TERMS & CONDITIONS

Our products are supplied under the following terms and conditions, which cover material in all forms including paper, electronic, etc.:

CONFIDENTIALITY

All information provided is strictly confidential unless otherwise stated. The Client is responsible for safeguarding this confidentiality. The information contained in our publications is provided only for legitimate commercial purposes; it is not to be used in legal or anti-trust action against others.

COPYRIGHT

At EMGE we aim to assist clients in using our information, however it is your individual responsibility as well as that of your company to abide by the rules and regulations as set out under European & International copyright law.

Terms for standard usage

- Making copies of our work is not permitted. No part of any EMGE publication may be reproduced in any form, for external or internal use, without prior written permission from EMGE.
- You do, however, have permission to replicate small samples of non-sensitive information as required, on the condition that you clearly acknowledge the source.
- If you have any doubts as to the legitimate use of our information, please contact EMGE.

Terms for Groupwide Distribution Licence holders only

- Copies of EMGE publications purchased under a Groupwide Distribution Licence may be distributed internally within the group only. Normally licences are granted under a regional basis, unless specified as a Global Groupwide Licence.
- None of the material provided may be copied or shown to other companies, industry consultants, finance companies or investment houses, under any circumstances.
- You do, however, have permission to replicate small samples of non-sensitive information as required, on the condition that you clearly acknowledge the source.
- If you have any doubts as to the legitimate use of our information, please contact EMGE.

DISCLAIMER

While we aim to ensure that the information contained in our publications is as reliable as possible, we cannot accept responsibility for actions or decisions taken by the client, other company or person arising from our work.

Sources and Acknowledgement

The EMGE WORLD GRAPHIC PAPER report contains data and 5-year forecasts for paper demand, supply and price around the world.

To compile these reports we have used an extensive range of sources, including all published information available to EMGE & Co. Ltd. In addition to published data, we have made reference to much industry data, which companies have been willing to share with us non-confidentially.

Furthermore, we have applied our own market research resources to gather additional information, and included information from other co-operating companies.

The EMGE databases are updated daily. We publish these forecast reports twice a year (March/April and September/October), with new data and revised 5-year forecasts.

The forecast timescale is 2011 to 2016.

Definitions

Paper activity data are based on Volumes as sold, measured in metric tonnes (data have been converted from short tons to metric tonnes where appropriate).

The grades referred to in this study encompass Printing/Writing Paper grades as described below in their respective definitions *(some regional differences in definition do exist).* A separate study on "World Newsprint Markets" is also available.

Uncoated Mechanical (UM) - includes offset and gravure uncoated woodcontaining printing & writing papers, generally in the basis weight range >54gsm (e.g. SC Magazine), but including Directory, Improved Newsprint and other lightweight grades.

Coated Mechanical (CM) - includes offset and gravure coated woodcontaining printing & writing papers (>10% mechanical pulp), generally in the basis weight range 54-80gsm; but also includes ultra-lightweight coateds & heavyweight coated woodcontaining (as well as LWC & MWC) in sheets & reels.

Coated Woodfree (CWF) - includes coated Woodfree printing & writing papers (<10% mechanical pulp), generally in the basis weight range 80-300gsm; both 1 & 2-side coated free in sheets & reels are included.

Uncoated Woodfree (UWF) - includes uncoated Woodfree printing & writing papers (<10% mechanical pulp), generally in the basis weight range 60-150gsm; in folio sheets, reels and cut-size, covering both bulk grades and uncoated specialities.

Coated =	Coated Mechanical + Coated Woodfree
Woodfree =	Uncoated Woodfree + Coated Woodfree
Printing & Writing (P&W) =	Uncoated Mechanical + Coated Mechanical + Coated Woodfree + Uncoated Woodfree
Graphic Paper =	Printing & Writing + Newsprint

Demand / Consumption - calculated as Production + Imports - Exports

Production / Output - paper mill saleable production

Trade - Net Exports, i.e. Production - Consumption

Capacity - Annual Machine Capacity, based on technical, not market, conditions

Operating Rate - Theoretical Ratio of Production to Capacity

M/c – Machine

Details of Country groupings in the Regional Tables are shown in the Country Data World-wide section (see page 49).

Report Contents

EMGE's WORLD GRAPHIC PAPER report (WGP), provides a unique and comprehensive database of world markets, assessing the current situation and the market outlook for the complete range of products in all world regions.

World Graphic Papers - a unique, global and fundamental perspective on the prospects for this important and dynamic industry.

The aim is to provide an objective update of the prospects for world paper markets – i.e. Coated Woodfree, Uncoated Woodfree, Coated Mechanical and Uncoated Mechanical (including Improved Newsprint).

The WGP report provides revised and updated forecasts of Demand, Trade, Output, Capacity and Operating Rates. The report covers the future global and regional demand-supply balance, by paper grade. The forecast timescale is 2011 to 2016.

New forecasts for Demand-Supply from 2011 to 2016.

In order to assess the impact of consolidation and changing industry structure, the report provides detailed rankings of Leading Suppliers, by grade, region and total. At the request of our clients, these tables include regional summaries.

Detailed rankings of Leading Suppliers, by grade and region.

Furthermore, we have incorporated special research into the Herfindahl-Hirschman Index, which is an index based on market shares which is used by the Authorities to gauge the levels of concentration in an industry. We have applied this index to the Paper Industry and coined the term the Pi-HHi (pronounced "pie-high").

EMGE's Pi-HHi – Herfindahl Hirschman Index.

We also provide country-by-country data for 2011. In addition, the report incorporates the latest information regarding capacity changes and investments, including M&A activity.

Incorporating the latest announcements for capacity changes and investments.

As well as a comprehensive collection of market data, great care has been taken to assess machine capacity in detail. The capacity data used are mainly based on announced, financed and confirmed plans, as well as some assumptions and forecasts made by EMGE (e.g. unspecified closures). The report provides additional information on all announced plans, whether decided or not (see tables of Machine Investment Listings on page 73, which compare "decided" and "undecided" machines).

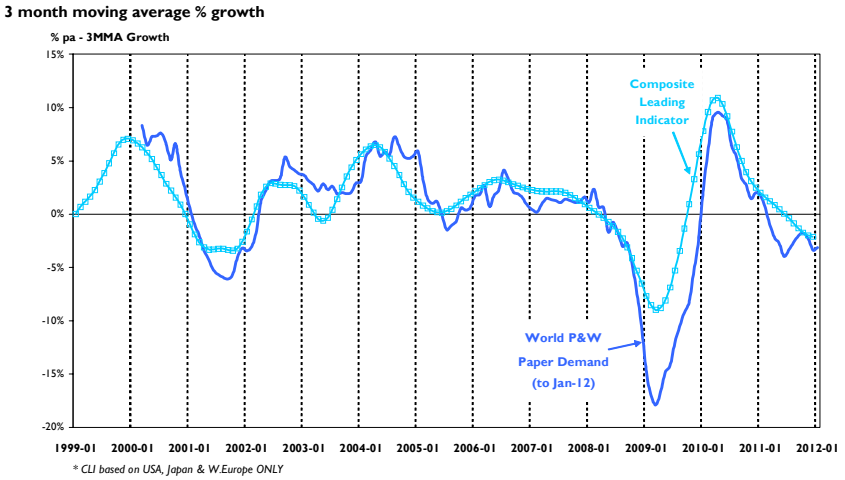
Introduction

FIGURE 1. WORLD P&W PAPER DEMAND vs. OECD LEADING INDICATORS



* *The OECD Composite Leading Indicator is based on a various financial and business factors, which are calculated statistically to provide a few months' advance notice of economic activity – in this instance we have combined the OECD, USA, Japan and W.European series as a proxy for the world index.*

The **EMGE WORLD GRAPHIC PAPER FORECAST** report is a comprehensive, unique and independent assessment of the future for the paper industry. The latest report ("WORLD GRAPHIC PAPER - *MARCH 2012*") is an update in the **EMGE** series WORLD GRAPHIC PAPER, covering fundamental global market issues.

The above chart shows that global paper demand has been on weakening since the first half of 2010, again broadly in line with the OECD leading indicators of economic growth. Having turned negative during 2011, Pr/Wr paper demand for the full year fell by -2.2%, with publication papers (CWF -3.4%, CM -3.3%, UM -3.9%) suffering worse than UWF (-0.5%).

Looking forward, economic pointers around the world are currently quite mixed. Falling inflation in many markets (notably China and India) has given rise to hopes that these countries will now be able to ease fiscal conditions to promote stronger growth. In addition, recent signs from the USA, suggest that a modest economic recovery is underway. In Europe, however, government spending cuts have led to predictions of a brief recession in Europe this year, while worries about sovereign debt in the Eurozone persist.

Based on all the data available and combining the latest developments in the markets, we review past and current market conditions and examine the drivers and prospects for future change, to provide subscribers with an updated outlook for demand, trade, investment, capacity, operating rates for the world Printing and Writing paper markets.

The following table shows the summary global forecast for each paper grade **(MARCH 2012)**

The table summarises the capacity and world paper demand forecast by grade which are shown in more detail throughout the report and discussed in the following Commentary pages.

This forecast includes:

- **A marginal (-0.4% pa) average global paper demand decline from 2011-2016.**
- The current decline in demand to fizzle out now that the panic over Greece has eased for the moment, also with Japan recovering step by step from last year's earthquake/tsunami, and boosts expected from the Olympic Games and the Euro 2012 football championship this summer, as well as the US Presidential Election later this year. The current fall in paper demand is predicted to slow and reverse, turning to growth during 2012.
- However, after 2012, we forecast a very weak 2013, with the USA making new budget spending cuts following the Presidential Election. This is expected to slow the US economy and so impact the rest of the world in 2013, and this will negatively affect paper demand.
- Once the market has adjusted to the US spending cutbacks, we expect China's government to respond by spending more to stimulate economic growth. This is expected to help to improve consumer and business confidence, thus driving a recovery and a return to growth (including paper demand) during 2014, strengthening further in 2015. For global paper demand, there will be no lasting fundamental strength to this recovery, however, and a new decline in demand is predicted for 2016.
- Regionally, demand growth in emerging markets and declines in mature markets are predicted to add up to a marginal (-0.4%) overall decline in global Printing/Writing demand for the 2011-2016 period.
- With demand poised to edge downwards, capacity management will again be the most important issue during the forecast period, as the industry is already suffering from overcapacity. Based on current confirmed plans, **Base Capacity** would rise slightly (by an average of +0.9% pa) during the forecast period, or a total of 2.4 million tonnes, with closures in mature markets being outweighed by investments, mainly in Asia. With declining global demand, this would worsen the oversupply situation.
- However, we are predicting that there will be even more capacity closures in mature and Asian markets, that have not yet been announced. These "Unspecified" closures are also forecast to be accompanied by not-yet-announced investments in Asia. All of these forecast **Unspecified Capacity** closures and investments are expected to add up to 4 million tonnes of additional capacity being taken out of the market.
- Combining the Base Capacity and these Unspecified Capacity developments, our EMCG **Forecast Capacity** shows a marginal drop in global P+W paper capacity (averaging -0.3% pa for 2011-2016).
- With demand and capacity both predicted to fall only slightly, we are forecasting that the global paper market will be generally oversupplied for most of the forecast period, although we do expect temporary periods of balanced supply and demand.
- Western Europe is forecast to remain the main paper exporting region, particularly in Mechanical grades, while China will continue to grow as an exporter, adding UWF to the CWF that is already exports.

Major events since last forecast

Almost 3 million tpa of new closures announced; inflationary economic cycle appears to be ending/ending

In this section, we provide a brief overview of the most important new developments that have taken place since our last report, and which have affected our new forecast.

- We warned in our last report that far more closures would be necessary to prevent huge overcapacity, but the industry has taken first action and announced new closures, which will remove 1.9 million more tpa of P/W/I paper capacity from the market than had been announced by the time we published our last World Graphic Papers report. Almost half of this will result from closures in North America this year (2012).

- Greece has, for now, avoided default, having at the last minute qualified to receive its latest slice/slice of bailout funding. This has eased short-term worries about stability in the Eurozone, although some analysts are saying the problem of Greece's finances is merely being delayed, not resolved. So, this is less of an influence on confidence in the short term, but it could well rear its head again during the forecast period.

- The US economy, meanwhile, has strengthened again, with GDP growth accelerating from just +1% in the second quarter of 2011 to +1.8% in the third quarter and +3% in the fourth quarter. Unemployment has also now fallen to a three-year low of 8.3%. This is expected to help slow the decline in paper demand, as well as giving the government breathing space to delay big spending cuts until after the Presidential Election in November this year.

- Although the prices of oil and many other commodities remain high, the year-on-year percentage increases have slowed considerably since our last World Graphic Papers report. This has reduced inflationary pressures around the world, which has encouraged several major economies to stop and/or reverse fiscal tightening programmes, which we expect to promote growth in the short term, at least.

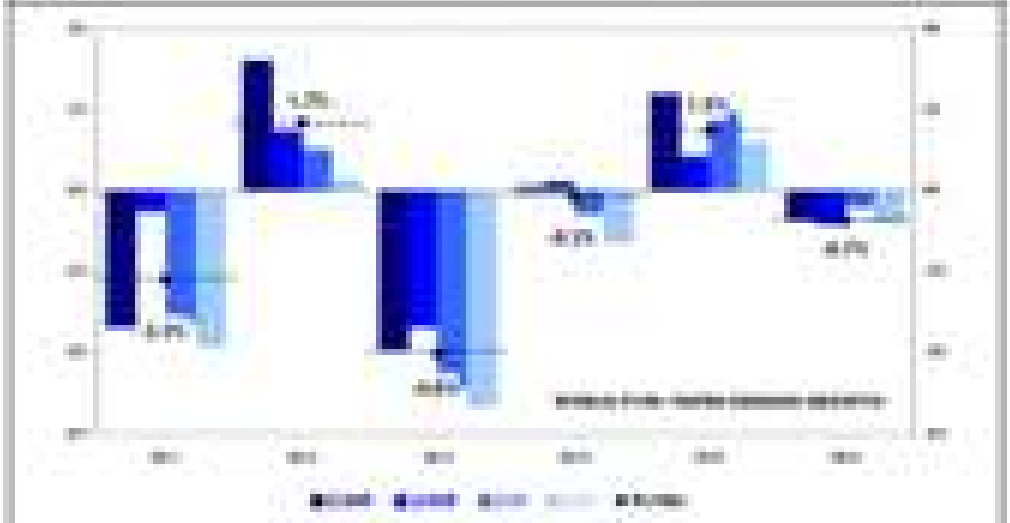
BLANK PAGE

A. Demand

A.1 Demand: Overview

FIGURE 4: PAPER DEMAND FORECAST, BY YEAR

World Demand Growth, PW Papers



In our view, the outlook for world paper demand remains negative in the long term, which is reflected in our forecast for the period 2013-2018 (-0.4%). This is a balance of a negative outlook in mature markets, with more positive prospects in emerging markets.

The negative outlook in mature markets is mainly due to competition from New Media, which are winning users and advertising spend from other media, including print. The few remaining sources of growth in mature markets are outweighed by the negatives.

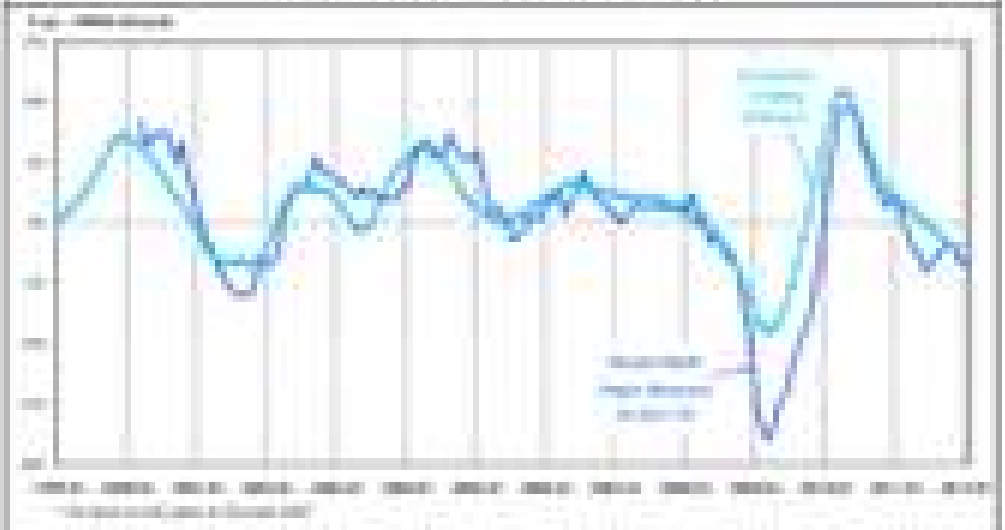
New Media are also growing rapidly in emerging markets, but despite this, printed media remain strongly in growth too, with print advertising growing by double figures in China and India, and also strongly in other major developing markets, like Brazil. Access to growing middle classes with disposable incomes. Developing countries are also seeing growth in service/office-based businesses which is driving consumption of printpaper.

Nevertheless, New Media are growing even more strongly than printed media, and we expect the negative influences seen in mature markets to become more of an issue in emerging markets in the longer-term future.

A.2 Demand: Short-term global developments

FIGURE 1: ECONOMIC INDICATOR

OECD Composite Leading Indicators



This chart is repeated on page x

OECD, [e.g.] [n.d., [n.d.]]

We examine the long-term, structural influences on demand later in this report, but first we outline how we believe the economic and paper market cycles will affect this paper market forecast.

The *Demand* section will look at the latest global (section A.2) and regional (A.3) developments and how they are influencing the short-term outlook, and this will be followed by our long-term outlook (A.4), including underlying structural influences on paper demand.

In the short term, declining apparent paper demand since early-2011 has been accompanied by a steady worsening of the short-term global economic outlook (see chart). However, there are some signs that this could be about as bad as it will get, we believe.

- Inflationary phase ending: Many countries, especially in developing regions, choked off money supply to combat inflation in the second half of 2011. However, inflation has now been falling for several months in many cases and governments/central banks are turning towards measures that will promote economic growth, rather than measures that will curb inflation.

- The US economy, which has struggled ever since the declining housing market popped the sub-prime loans bubble, has been improving in recent months, with growth strengthening to +3% in Q4 2012 and unemployment falling to a 3-year low.

- The short-term worry/panic over the stability of the Eurozone and a potential Greek default appears to have calmed for now, as Greece managed to avoid default for the moment and has re-negotiated some of its debts. This is a potential upside for Consumer Confidence.

- Slightly further ahead (by perhaps three months), the Olympic Games and the Euro 2012 football championships are expected to boost spending and the "feel-good" factor, which we expect to keep the business cycle on an upward trend until the latter part of this year. In addition, the US Presidential Elections in November 2012 are expected to provide a modest short-term boost to advertising and economic activity generally this year.

This chart shows our forecast for key Graphic Paper demand growth for 2012, by region:

There are still negative risks, of course.

- Oil prices have risen considerably (although they are currently falling again), and further rises could kick-start a new inflationary phase. That would almost certainly dampen economic growth.

- Many governments are still cutting spending, which may prevent economic growth and falls in unemployment. Several big markets appear so far managing the balancing act quite well, but this remains a risk.

However, we previously said that fears (about a Greek default and potentially the break-up of the Eurozone) were either not serious or not serious enough. If the feared thing happens, then consumers and businesses were not afraid enough. But for now, it has not happened, so perhaps they were more afraid than they needed to be.

Our belief that people's fears were exaggerated was one of the assumptions behind our previous short-term forecast and that remains the case for this forecast.

On this basis, and taking into account the positive factors mentioned previously, we are predicting global paper demand growth of +1.3% this year, led by developing markets, but even helped by growth in some mature markets (see chart).

Source: RISI, EMGE, PPI, APIPAC

It is also early yet to say whether slowest declines in global paper demand in late 2011/early 2012 already mark the start of the mini-recovery that we are forecasting for this year. However, with China expected to ease financial conditions further, with India predicting stronger growth, with the US economy already improving, plus further boosts expected from several seasonal factors (Olympics, etc.), we believe just such a mini-recovery will begin soon (it indeed, it hasn't already).

This is also predicated on both the current weakness in paper prices, helped by pulp prices which are already mostly up since the start of the year (especially hardwood pulp). This could even cause some replenishment of inventories in the first half of 2012, although we would expect actual rising paper prices to face a subsequent backlash in the form of falling order volumes before the end of the year.

To summarise, then, there has been no new financial crisis so far, so we maintain our existing forecast that the current decline in demand will bottom out very soon, with demand breaking back through to growth, during the course of 2012. Rising prices could keep the mini-recovery short-lived, however, although we do not expect the recovery to last into 2013 in any case.

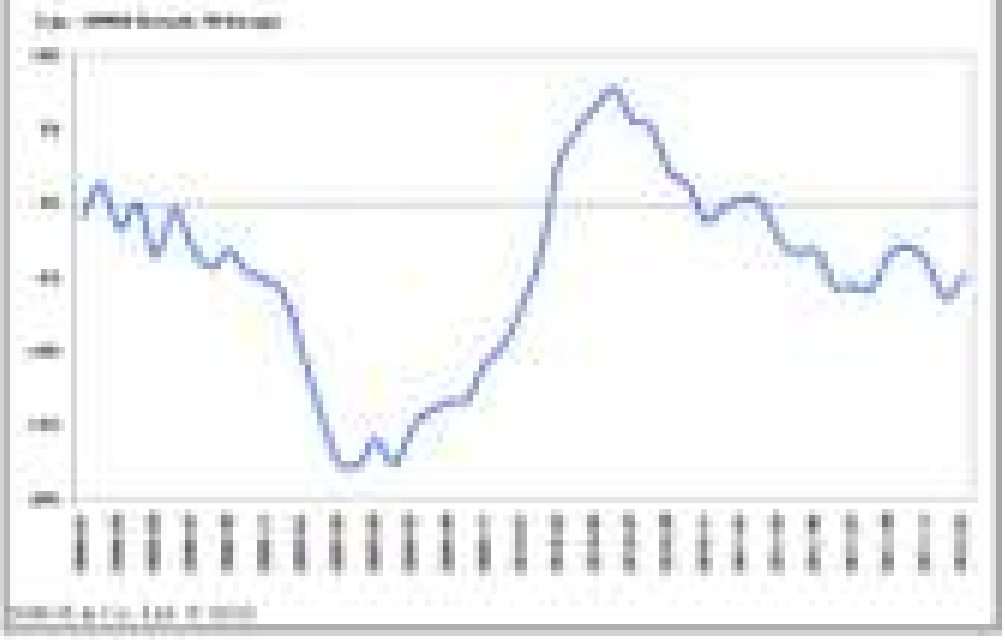
The following pages look in some short-term paper market developments by region.

1.3 Demand: Short-term developments in regional markets

1.3.1 Western Europe

FIGURE 8: NEW PAPER DEMAND GROWTH (3MMA)

W Europe



After a temporary mini-recovery in the early and middle parts of 2010, apparent paper demand growth in Western Europe fell back into decline and has now been falling since early 2011 (see chart). The 3 month moving average (3mma) growth rate weakened fairly consistently for a year or so until June 2011, but since then, it has rather flattened out at around -6%.

In our view, the real demand for paper is unlikely to get much weaker than this, because the demand drivers suggest the average declines are not worse than this. The worst of the demand drivers is arguably consumption of printed books, which is seeing declines of roughly -10%, while mail/letter volumes are falling by up to -6% in some cases (although less in Germany), and other sectors are suffering considerably smaller declines, too (e.g. German magazines are seeing only a moderate drop in circulation and roughly stable advertising, as of the second half of 2011).

We believe an aggregate of the major sources of paper consumption would suggest that real demand may even be falling by less than -6%. That would, in turn, suggest there has been some reduction in inventory volumes, and as prices were under downward pressure in 2011, inventory reductions would fit into phase of the business cycle.

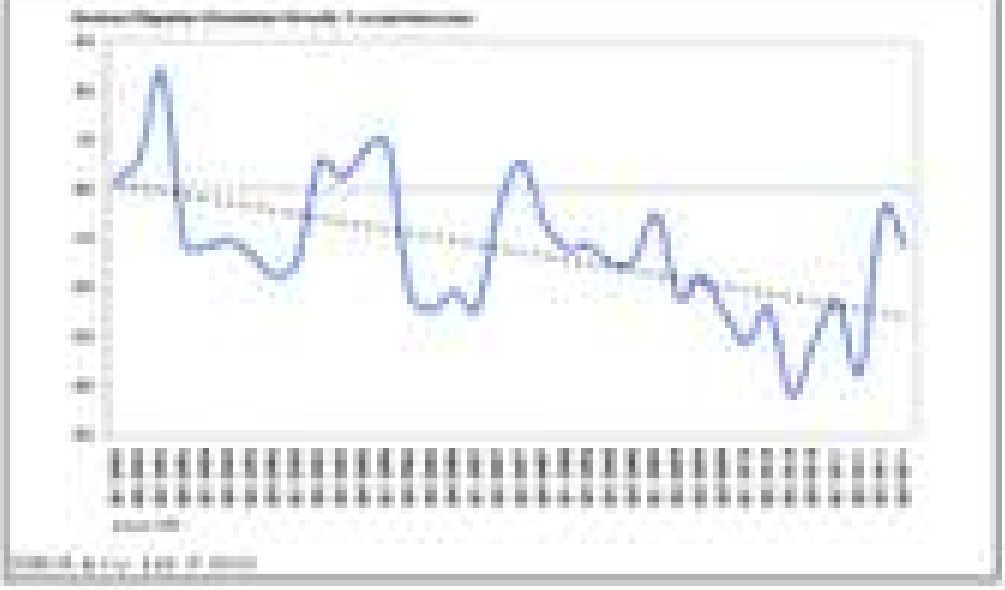
As the indicators from various end-use sectors have been mixed, so there were also mixed signs in the printing sector.

The UK printing industry was no exception. The January 2012 Printing Outlook Survey by the British Print Industries Federation showed a rise in demand and output at British printing firms, although the increase was less than had been forecast. Exports in particular weakened, amid concerns over the Eurozone. The Survey also showed that virtually no British printing firms are running at capacity.

Until February 2012, business had been weakening in the German printing sector, with industry sentiment in negative territory for four months in a row for the first time since mid-2010, amid the current business and very pessimistic future expectations, both for domestic and export sales. However, the picture changed quite radically in February, as sentiment improved back to neutral. However, this was not due to improved business conditions, as these actually worsened in February. It was future expectations which improved dramatically, despite the downturn in actual, current business.

FIGURE 10: MAGAZINE CIRCULATION

Germany



We mentioned earlier that indicators from end-use sectors have been mixed. In the magazine sector, however, recent pointers have been generally negative, although not as negative as in other sectors, e.g. books and mail.

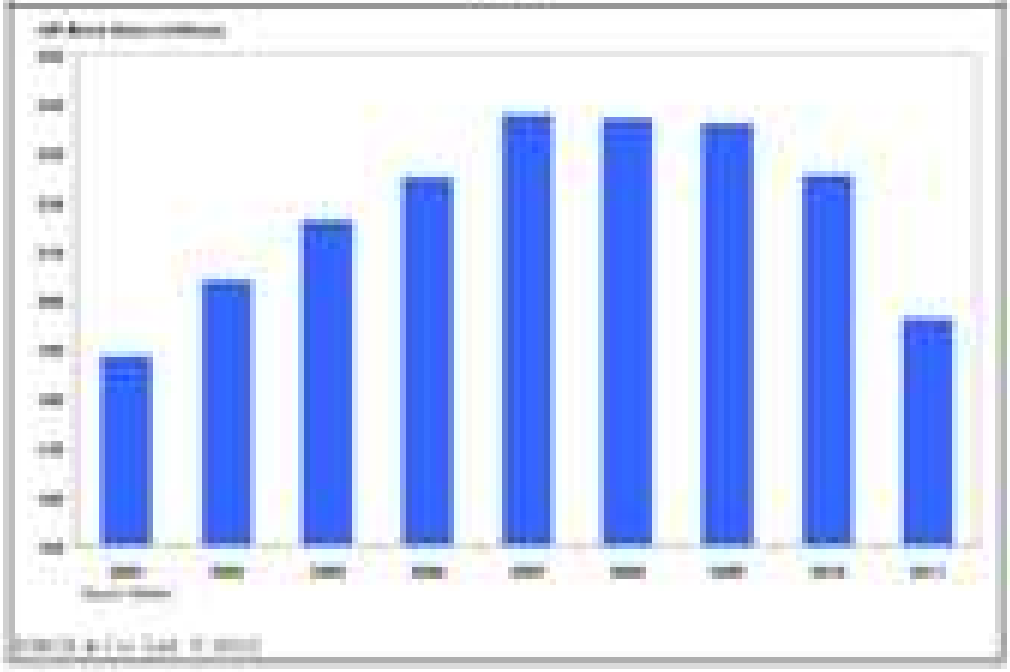
In the UK magazine sector, circulation has weakened from moderate growth in early 2011 to a decline in the second half of last year. The ABC figures showed a -1.4% drop in Total Average Issue Paid Circulation, although this was believed to be on a like-for-like basis, not including magazines which have stopped publishing. As such, we believe it is probable that total (not like-for-like) printed UK magazine circulation in H2 2011 fell further than -1.4%.

In Germany, magazine circulation has been falling by around -1.5% to -3%, with no clear sign in the past year that the trend is becoming significantly worse (although the long-term trend suggests that is set). In terms of magazine advertising, Germany has seen a slowdown during the past year, although 2011 did end up being a year of growth (+1.5%). However, this comprised growth of more than +3% in the first half of 2011, slowing to roughly zero in the second half of the year, followed by a decline in January 2012.

According to our forecasts, for much of this year, women nurses in Europe, as well as activity centred around the Euro 2012 football championships and the Olympic Games, will help to energise consumption, boosting intra-European visits and encouraging more marketing/advertising spend. This should help Uncoated and Coated Mechanical Papers and to a lesser extent, Coated Woodfree, and we are predicting that the current decline could turn around enough to produce a short period of growth, before a return to falling demand before the end of 2012.

FIGURE 11: UK BOOK SALES

2003-11



Quite in contrast to magazines, which are far from collapsing, printed books are far more under threat (mainly from e-readers/tablets, which we will examine in the *Living Lives Digitized* section of this report). There have already been double-digit losses in printed book circulation in some markets in 2011 and more expected, but all these developments are already recognised and built into our existing forecasts.

In the printed book sector, sales of printed books fell last year in at least the UK, Spain and Ireland (according to Nielsen BookScan), but we believe this was also the case in many other European markets, too. In the UK specifically, the number of print books bought in 2011 fell by -11%, according to Nielsen BookScan data, and this continued in January, with a further drop of -12% in the first four weeks of the year. Nielsen BookScan commented that much of the decline is being widely interpreted as the impact of sales moving over to e-books, especially in the Adult Fiction segment. Separately, it has also just been announced that the renowned Encyclopaedia Britannica (a 32-book hardback set of combined knowledge) will no longer be printed.

In the mail sector, meanwhile, fortunes vary from country to country although the sector remains clearly in decline. If two of Europe's largest markets are any guide, in Germany, for example, Deutsche Post DHL reports that "letter volumes continue to gradually decline", whereas the downturn is rather steeper in the UK, where the country's leading mail carrier, Royal Mail, reported a -4% drop in letter volumes in the half year to September 2011. Further falls are also expected as result from a new scheme between the UK

governance and the direct marketing industry, to set up a website this year that will enable households to opt out of receiving all advertising mail. This is not a sector where we expect much cyclical improvement in the short term.

Although up-to-date published data are not available for all sectors, we believe most other end uses in Western Europe are also contributing to real drops in paper consumption, with areas of growth (such as total German magazine advertising last year) few and far between.

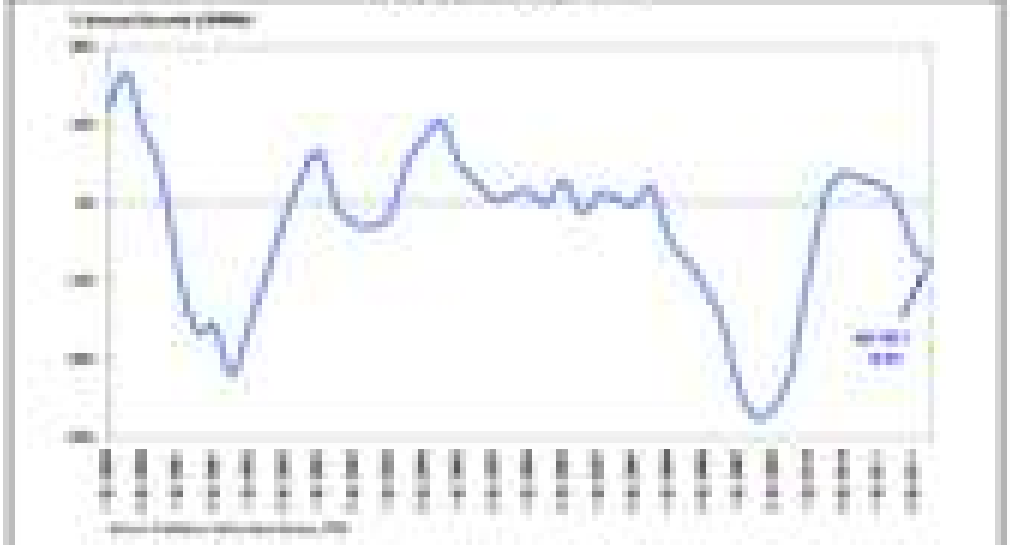
The printing sector, meanwhile, is rather more difficult to analyse, but there is just a hint that the industry believes better times may be just around the corner.

However, it is fair to say that if we are correct in our short-term forecast, and that an improvement is about to begin in the coming weeks, then there is little sign of it in the available data so far. Nevertheless, we believe there is good reason to expect that to happen, and we expect the data to begin reflecting it by the second quarter at the latest, and probably sooner.

4.1.2 North America

FIGURE 12: MAGAZINE ADVERTISING PAGES – USA

US Magazine Pagination



In North America, demand from the USA accounts for around 90% of the total (as of 2011), with Canada making up the rest.

In the downmost US market, some of the major drivers of paper demand have continued to weaken, and there are virtually no plus points on the horizon.

The slowing trend in magazine advertising, for example, continued in the second half of 2011, with year-on-year growth weakening from +1.1% in the first half of the year to -1.2% for the first three quarters of 2011, and then -3.2% for the full year, due to a slump of -8% in the final quarter of 2011. This followed broadly stable (+0.1%) magazine advertising in 2010.

The trend in mail volumes has also been weakening. The United States Postal Service has reported a decline of -8% in total mail volumes in the fourth quarter of 2011. This compared with a -1.7% fall for the full 2010-2011 financial year, with first-class mail and marked periodicals (the more paper-intensive pieces of mail) falling more steeply than other forms of mail (e.g. packages, etc.)

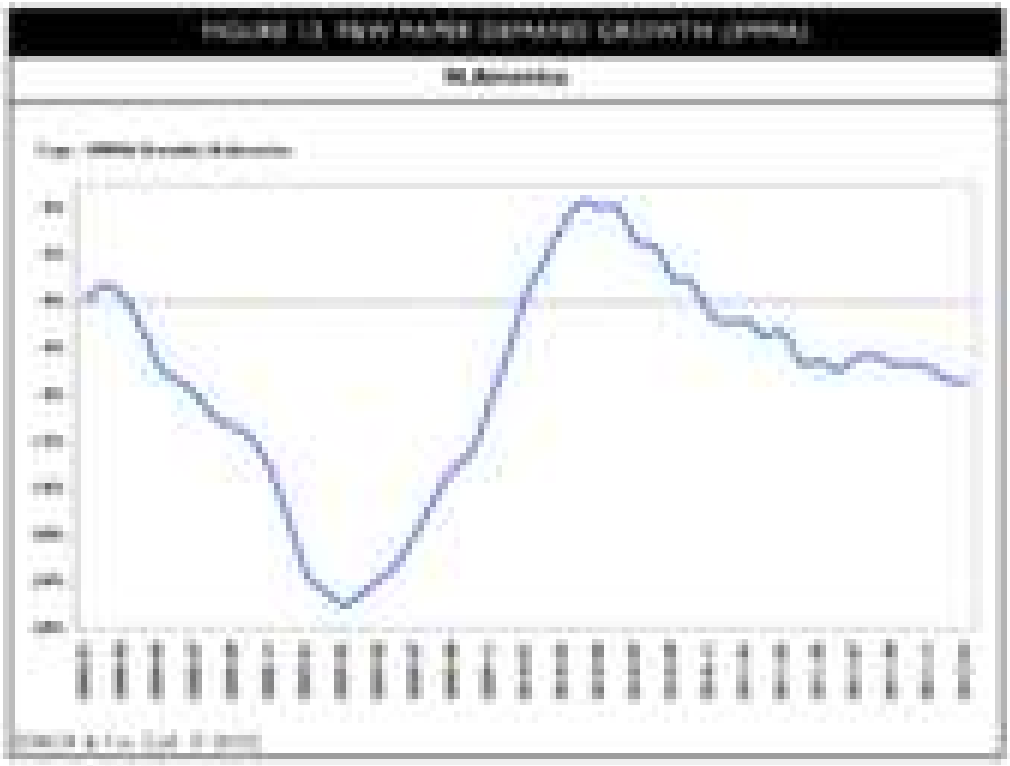
The story of weakening trends is similar in the printed book sector. According to Nielsen BookScan, sales of printed books in the USA fell by -4.3% in 2011, following a drop of -4.4% in 2010.

Overall, however, the weaker trends in several end-use sectors have not been showing up in the print sector. Although turnover in this sector is generally in decline, there is no obvious worsening trend and indeed, there are still occasional pockets of year-on-year growth in individual months (such as August and September 2011), which is very much in contrast with paper demand. True, print turnover has been in decline following the boost August and September, but at no worse rates than for most of the rest of 2011. In total, US printing companies' turnover fell by around -3% in both 2010 and 2011, and this trend broadly continues, with a drop of -2.4% in January 2012.

Separately, US unemployment has eased slightly in recent months, and economic prospects in the USA have generally been improving. This should mean, for example, less downward pressure on office paper consumption.

Looking to the short-term outlook, several forecasting firms predict that US advertising expenditure will rise by around +4% this year, helped by spending on the Olympic Games and the US Presidential election. However, media and advertising forecaster, PlogneGlobal, is predicting that print will not share in this growth, forecasting a drop of -5.2% in magazine advertising. This would mean a continuation of the currently worsening trend in that sector. Considering the short-term upside factors we have mentioned, we expect PlogneGlobal's predictions to turn out to be slightly pessimistic for this year.

FIGURE 13: NEW PAPER DEMAND GROWTH (3MMA)



North American paper demand, meanwhile, has been on a downward trend since the mini-recovery of 2010, and has been in decline since late-2010 (see chart). And while Western Europe, the fall in apparent demand for paper has been broadly in line with the known end-use pointers (recent declines in US book sales, mail volumes and magazine advertising, for example, would roughly average out at -4%).

As mentioned in our last World Graphic Papers report, however, the current downward trend in North American paper demand has slowed, although it has not yet bottomed out. There has been some economic improvement, as we previously forecast, although the influence of that on paper demand has not yet become apparent.

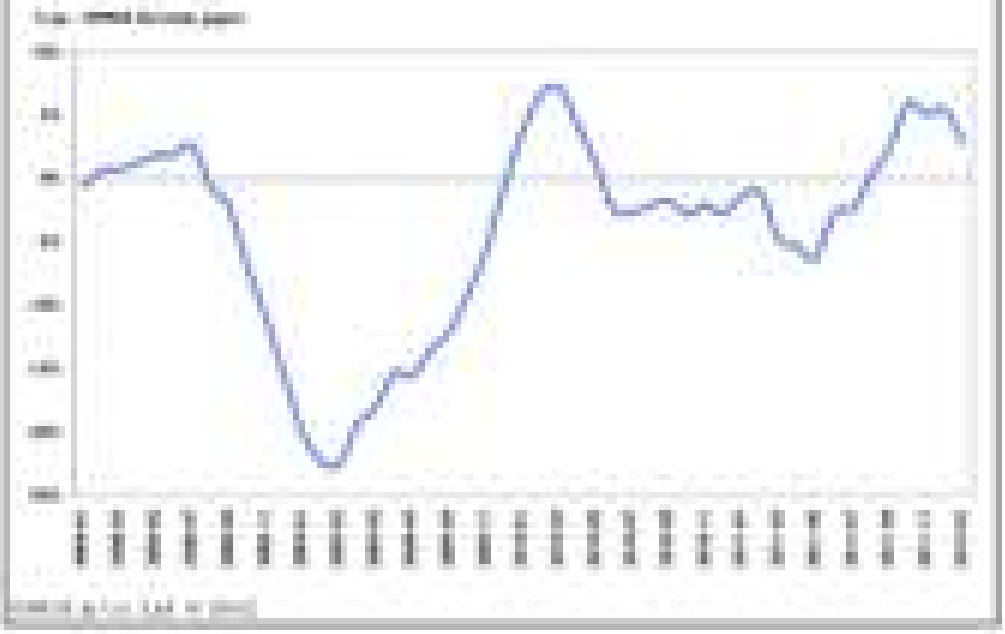
Still, with added impetus from the Olympic Games and US Presidential Elections this year, we expect continued improvement in the business cycle and some of this is predicted to feed through to paper demand very soon, i.e. the start of an improving demand trend should become visible in reported data by around March.

We are forecasting that the decline in paper demand will ease this year, to -3.3%.

4.1.3 Japan – growth for now, but with risks

FIGURE 14: NEW PAPER DEMAND GROWTH (PPPM)

Japan



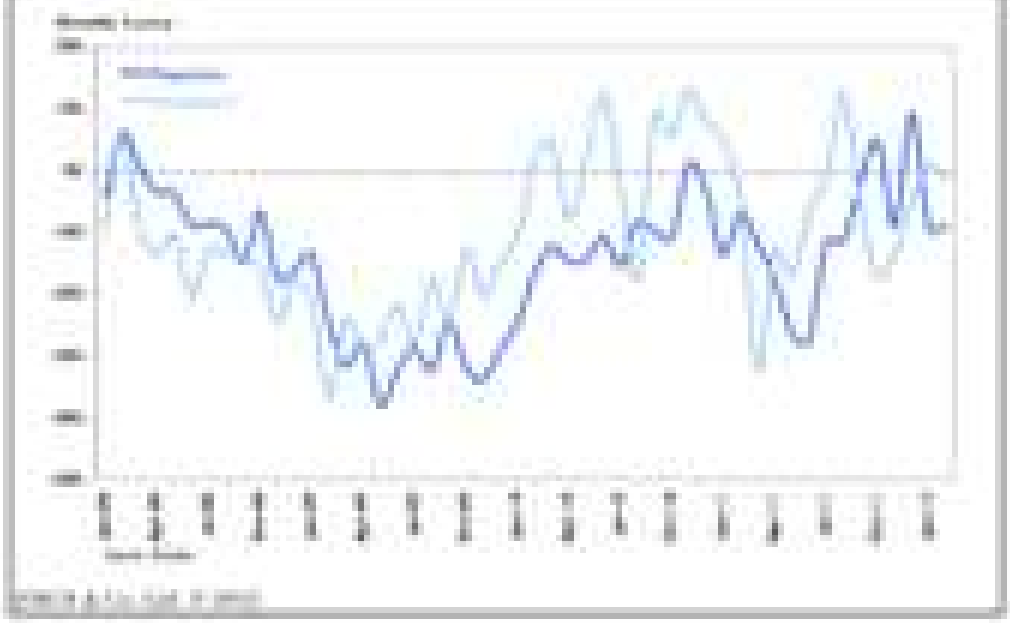
We said in our last World Graphic Papers report that we believed there were reasons to expect a short-term improvement in the economy and paper demand trend in Japan. This was mainly related to expected government spending to repair damage from the earthquake/tsunami back in March 2011.

The government spending and the short-term improvement in paper demand did indeed take place (see chart for paper demand), with paper demand growth apparently in around +5% to +6% in late 2011, while still remaining clearly in positive territory.

Interestingly, paper demand has actually been rather stronger than the relevant end-use indicators might suggest in recent months. For example, demand growth in the 6 months to January 2012 has been strongest in the Coated Mechanical sector, which we associate to a large extent with the magazine sector. However, growth has not been especially evident in the magazine sector. Although there have been some individual months of growth, the magazine sector in Japan has actually seen its income fall more often than grew since the tsunami in March 2011. And Japan's advertising giant, Dentsu, further reported declines of -9% in magazine advertising in both January and February 2012.

FIGURE 11: ADVERTISING TRENDS (APRIL)

Dentsu's monthly advertising revenues



Losing any sustained growth in magazine advertising (see chart) during the current phase of paper demand growth, then whilst magazine pagination was boosted by expanded editorial as circulation has been growing. We actually consider both of these to be possible, as coverage of the earthquake/tsunami disaster and its aftermath will have been interesting than both editors and consumers wanted, we believe.

However, in our view, there is also more to the story of recent paper demand growth than just consumption of magazine papers: even though Coated Mechanical paper demand has been growing more strongly than other Printing & Writing grades, there has been in growth in other sectors, too.

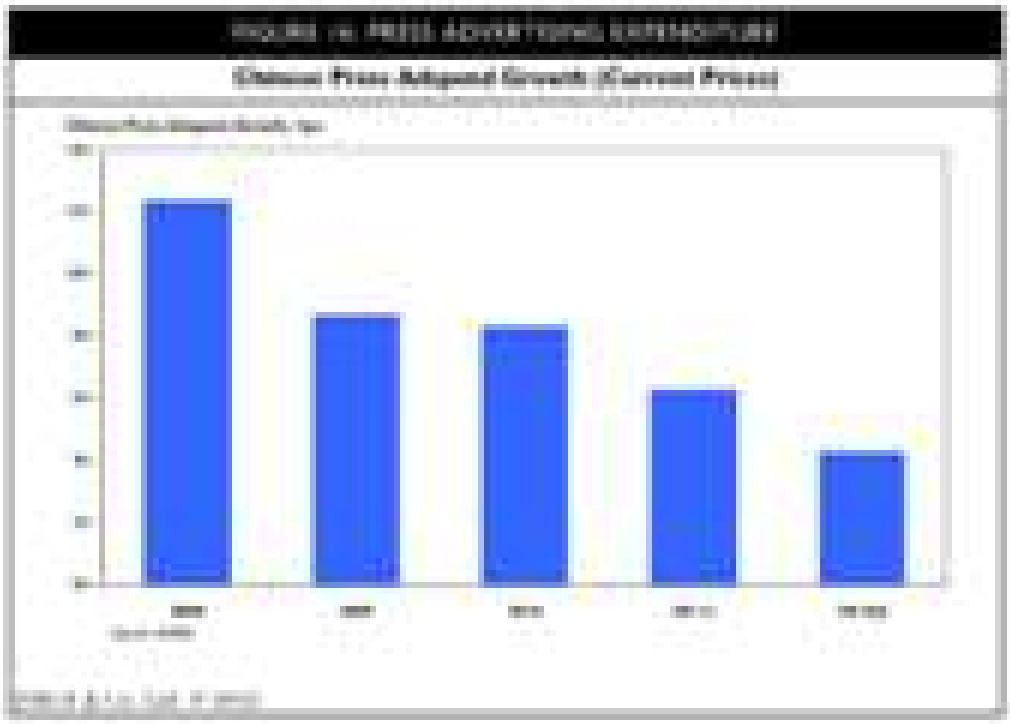
In Dentsu's annual advertising review for the full year 2011, total Japanese advertising expenditure is reported to have fallen by -2.3%, marking the 4th consecutive year of declines. However, this consisted of a poor start to the year, with an understandably very weak March. However, once the initial turbulence of the tsunami had been braved, Japan's advertisers actually generally became more active in their spending generally. This included growth in most months in categories such as "Marketing/Promotion" and "Classified" advertising, which we believe will include a proportion of printed newsprint, as well as other media.

The overall expenditure on advertising and marketing grew strongly last summer, weakened in October/November, and after a strong finish to the year, has eased to be roughly stagnant in the past couple of months.

However, in the very short term, we expect strong growth compared with the immediate months aftermath of a year ago, and government spending will continue, which should support employment levels. A major downside risk, however, is power shortages affecting production, as Japan is now producing virtually no nuclear power any more, and there are serious questions about whether there will be enough power available at peak times.

Against the background of all these factors, and considering the shape of our forecast economic/market cycle, we are forecasting continued, although slower (+2.1%) paper demand growth in 2013.

4.1 # China & India



There have been concerns in recent months that counter-inflationary efforts in both India and China could slow economic growth. And indeed, in the fourth quarter of 2011, both countries did see a modest slowdown, although this is relative to their previously very rapid growth.

China's economic growth slowed from +9.1% to +9.1% in the third quarter of 2011 and further to +8.9% in the fourth quarter, resulting in full-year growth of +9.2%. None of these rates are what anyone might call slow. In addition, the Chinese government has reduced its official target rate of economic growth for 2012 to +7.5%. However, China regularly beats its target growth rates, and has recently been easing fiscal conditions, suggesting that it is now targeting growth ahead of controlling inflation. Many analysts expect growth to beat targets again this year, with several recently upgrading their forecasts for Chinese growth in 2012.

Raising specifically on paper demand drivers, CTR Market Research reports that the average growth for advertising in all traditional media in China last year was +10%, although the rate decelerated in the fourth quarter of 2011. CTR forecasts that 2012 will see advertising growth of +11%, and WARC made a similar prediction of +11.5%, while MagnaGlobal was more optimistic, with a +16.1% forecast. WARC predicts that print (see chart) will perform below the market average, however, forecasting growth of +4.3% growth in advertising in 2012 for newspapers and magazines combined.

Others are more upbeat, however. Group M, for example, earlier forecast that Chinese magazine advertising would grow by +12% in 2012. And CTR reports that advertising expenditure in print media last year was broadly in line with the average for all traditional media, with magazines in China seeing +14% growth. Magazines gained some market share from newspapers, particularly in the transportation sector, CTR said. Magazines were also credited with having success in targeting high-end consumer groups, with a leading share of magazine advertising being for personal care products. This is a good sign for magazines, as growth in advertising for high-end products and services has been very strong, as the Chinese population's standard of living and financial situation improves.

In our view, the rise in advertising and marketing expenditure will contribute to paper demand growth, although at less than a 1:1 ratio. This is partly because we expect that magazine publishers will be looking to improve profit margins, following a period of strong cost inflation, and will thus likely increase their prices for advertising, as well as not matching every new advertising page with a page of editorial.

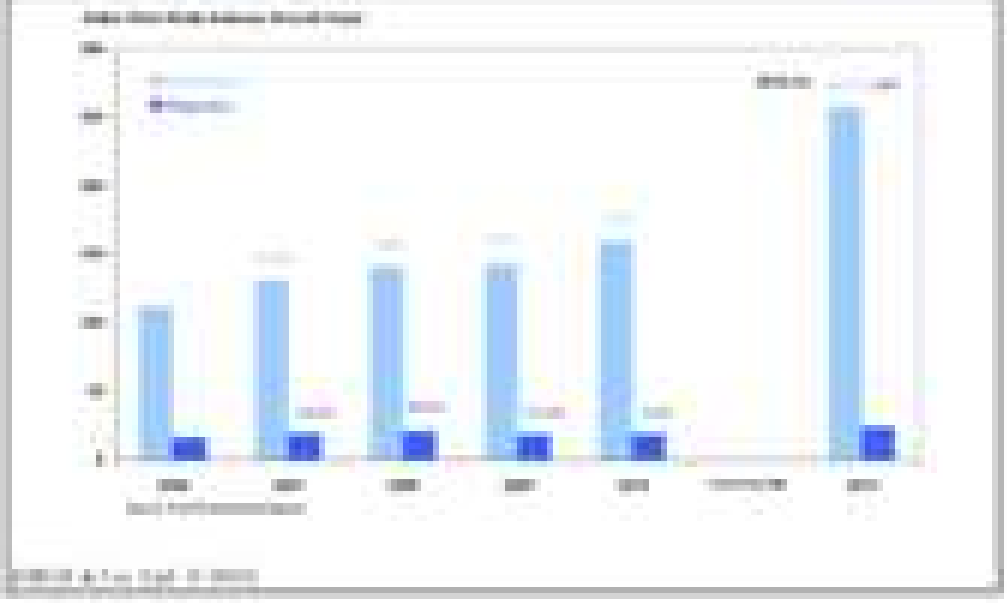
Other forms of printed marketing materials may benefit more directly, being viewed as a cost, rather than a source of direct profit creation.

Furthermore, with economic growth expected to continue at a very healthy pace, with a rising share of middle class jobs being created, office paper consumption is expected to be boosted, as well.

Thus, we are forecasting healthy growth in demand for most paper grades for much of this year.

FIGURE 17: INDIAN PRINT MEDIA IN GROWTH

PricewaterhouseCoopers



In India, meanwhile, economic growth slowed from +7.7% to +6.9% in the third quarter of 2011, but the slowdown appears to have been short-lived, with growth strengthening considerably in the fourth quarter of 2011, according to the International Monetary Fund. And the Indian government recently predicted that growth would accelerate further again, to the +8% to +9% range.

In terms of paper demand drivers, according to Aditya Inoka, exec at TAM Media Research, print advertising in India grew by +16% in the first half of 2011, accelerating slightly to +17% for the year to September of 2011. For this year, WARC and PageGlobal expect a moderate slowdown, but still very rapid growth, even then, at around +13% or +14%. PricewaterhouseCoopers earlier forecast that India's print advertising would grow by an average of almost +12% to 2015. PricewaterhouseCoopers also earlier predicted that circulation income in print media will grow by +5%pa or faster to 2015.

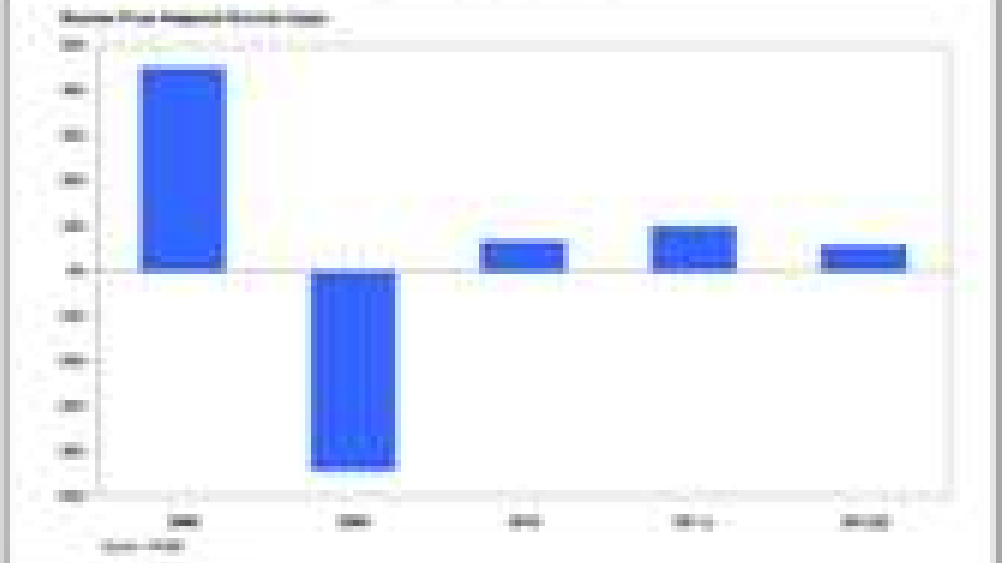
Outside of publishing, Office Paper demand is also growing at double-digit rates, due to rapid growth of India's service sector, which is no doubt one of the factors that enticed International Paper to enter the Indian market last year, with the purchase of Andhra Pradesh Paper Mills. Separately, investment in the Indian education system is also creating healthy demand for school-related printed materials.

In our view, partly due to government economic and partly due to expansion and enrichment of the countries' middle classes, we see China and India as two of the classic out-sources of paper demand growth in the short-term (and further ahead, too).

4.1.3 Eastern Europe

FIGURE 18: RUSSIAN PRESS ADSPEND GROWTH

2008-13 (Constant Prices)



The Consensus Economic Forecasts for 2012 GDP growth in Eastern Europe have been steadily downgraded every month over the past 6 months, from +4.0% back in September 2011 to just +2.8% in February 2012. While growth there will be is expected to be counterbalanced by an expected sharp decline in Greece this year (see chart above), thus reducing the overall average growth (in this report, Greece is included in "Other Europe").

Despite the slowing expectations, economic growth is nonetheless expected to be moderately healthy. This is predicted to lead through to marketing and advertising, with price performing far better than in more mature markets. In addition, the economic growth is also expected to help reduce unemployment, boosting consumption of office papers.

Looking at advertising specifically, we expect a boost in the middle of the year from the Euro 2012 football championships in Poland and The Ukraine. And both the economy and especially advertising are expected to grow strongly in Russia this year, and we expect some spill-over into other markets in Eastern Europe.

Media investment company, PhaseGlobal, is forecasting that advertising revenues in 2012 will grow by +7.7% in Central and Eastern Europe this year. Group M is predicting slightly slower, but still very healthy, growth of +5% this year, after inflation.

Against this economic and media background, our short-term paper demand forecast is for growth of +4.9% in 2012.

4.1.6 Latin America

FIGURE 19 FIXED ADVERTISING GROWTH

Brazil (Current Prices)

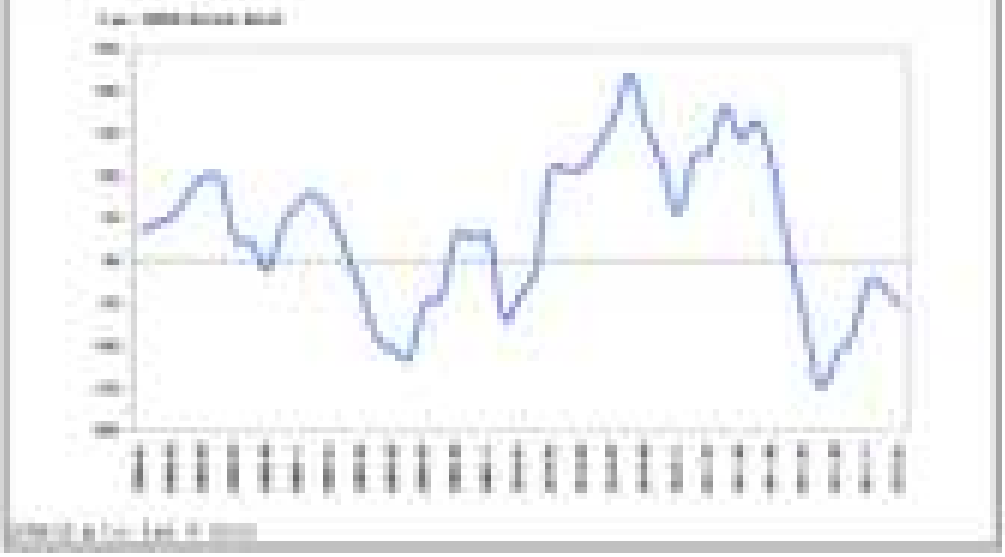
In the Latin America region, following strong economic growth in 2010 and for most of 2011, the economic outlook eased slightly in the latter part of 2011, although is now appears to have stabilised. The Consensus Economic Forecast for 2012 slipped down each month from +4.1% in September 2011 to +3.5% in January 2012, before edging up to +3.6% in February.

However, advertising is one segment of the economy that is outperforming the general economy, with companies keen to access a growing middle class and its growing disposable income. MagnaGlobal, for example, is predicting +13% growth in advertising expenditure in Latin America this year, led by Argentina (+26.4%) and Brazil (+12.8%). And for print media specifically, WARC earlier forecast for 2012 an acceleration from strong single-digit growth in 2011.

This is in line with our own forecast of stronger growth in 2012, due to the shape of the forecast cycle explained earlier in this report.

FIGURE 10: NEW PAPER DEMAND GROWTH (PPPM)

Brazil



In Brazil, meanwhile, by far the largest market in the region, the Instituto Verificador de Circulação (Circulation Verification Institute) has reported a slowdown in magazine circulation in the second half of 2011, leaving the growth for the full year as only +0.3%.

Advertising fared rather better, in contrast, growing by +9% in 2011, in real terms. For this year, Group M and WARC are forecasting growth of around +8% or so, in real terms. Also this year, print media are expected to underperform the average growth, while still performing fairly well. This also appeared to be the case in 2011. For example, according to the Inter-Media Project, a regular study by PricewaterhouseCoopers for Brazilian magazine 'Meio & Mensagem' (rough translation: "Media & Communication"), Brazilian magazines achieved advertising growth of +13.6% in the first three quarters of 2011, i.e. around half of the average growth for all media.

To a large extent species from the paper grades influenced by marketing and advertising. Uncoated Woodfree demand makes up a big part of the Latin American market. In this sense, we expect demand to track economic activity reasonably closely, relating to business investment and office employment numbers. As mentioned on the previous page, economic expectations have softened recently, but we still expect moderately healthy activity in 2012 (although nothing like as strong as the growth in advertising).

Despite generally upbeat indicators, Brazil (which accounts for more than 40% of Latin American paper consumption) has actually reported falling paper demand in each of the last 6 months (see chart above). Much of this was due to paper buyers reducing inventory following massive inventory building during 2010 (apparent demand surged by more than

+20% in recent months during 2010, pushing full-year growth above +10%. Thus, we believe the declines in recent months are largely unrelated to real paper consumption.

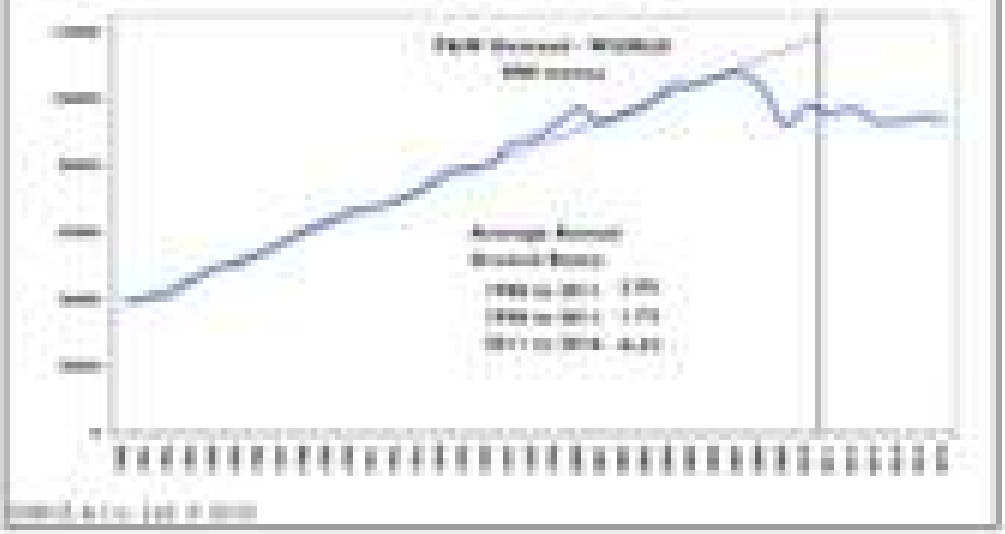
In fact, we expect the inventory reduction phase to end very soon, and for apparent demand to grow again in Brazil, and by extension, boosting the Latin America total, too. Our forecast for 2013 is for Latin American paper demand to grow by +3.3%.

A.4 Demand: Long-term outlook

A.4.1 The market cycle to 2016

In this period between 1998 and 2007, Global Paper Demand followed a positive trend, but following the GFC in 2008, demand collapsed as did its decline between 2011 and 2012. It'll take another

FIGURE 11 : GLOBAL PAPER DEMAND TREND FROM 1980



The previous section of this report examined the short-term outlook for global and regional paper demand, focusing on 2012.

After 2012, our forecasts are then based on a very weak year in 2013.

Just the absence of 2012's "enhanced" factors (Olympics, Euro 2012 football, US Presidency) Elections) would be a negative driver, but much more importantly, we are also expecting the USA to make big spending cuts in 2013, subsequently impacting the rest of the world in 2013 (see next page for more detail).

FIGURE 12: US BUDGET DEFICIT – CUTBACKS NEEDED URGENTLY

One of the major reasons behind our forecast of a very poor 2012 is that the USA urgently needs to cut its public spending to reduce its budget deficit. The US deficit entered deep into previously uncharted territory during the financial crisis in 2009, and has been hovering around US$ 1.3-1.5 trillion since (see chart).

Economic growth alone will not, in our view, be anything like enough to rebalance the US government's income and spending, so spending will have to be cut, and we expect it to be cut fairly drastically. However, we do not expect the President to make the biggest – and most unpopular – cutbacks before the election in November this year, although we do expect them to begin shortly afterwards (whichever candidate gets elected).

So we expect the larger cuts to take place in 2013, which will slow the US economy in 2013, with the consequences being felt by the US's trading partners around the world. Slowdowns in those countries will then affect a second tier of trading partners, and so on.

Once the market has adjusted to the post-election spending cutbacks in the USA, we expect China to lead the recovery out of this slowdown, by loosening its fiscal policy in response to the slower US growth, helping to prevent the slowdown from becoming a global crisis, as it did in 2009. In addition, as most major economies outside of the USA will already have made some progress on reducing their own deficits by this point, we expect more resilience in these economies, giving them the potential for quicker recovery.

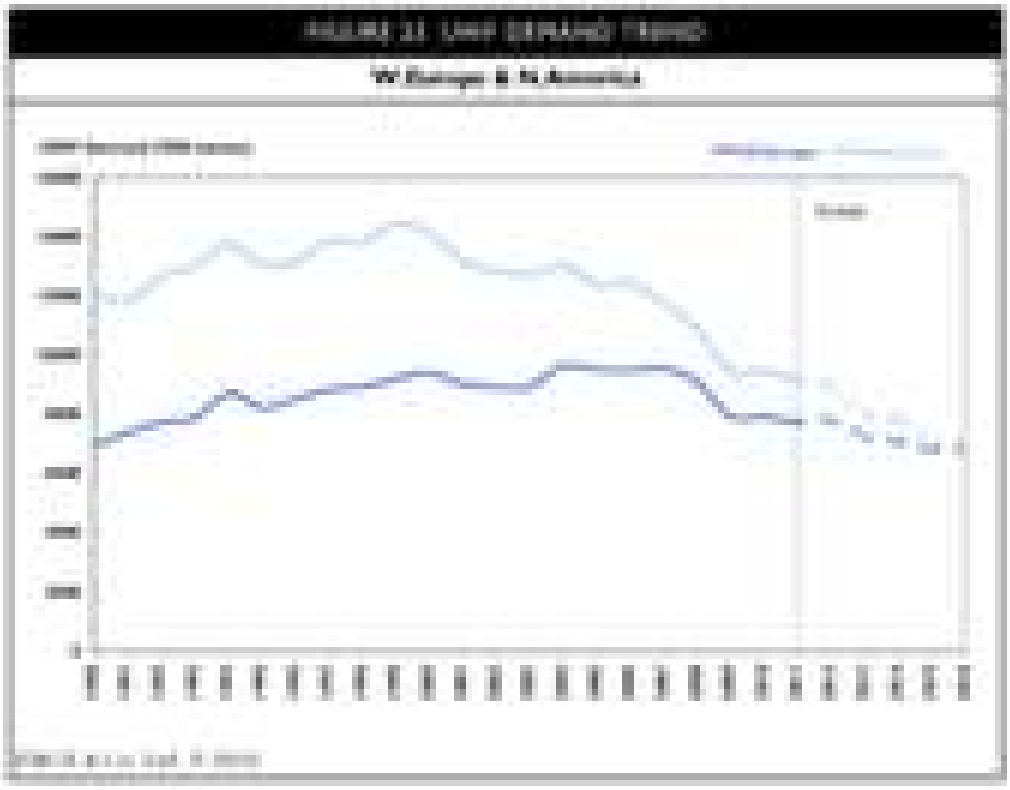
In terms of paper demand, we expect the weaker period to last through 2013 and bottom out in 2014, returning to growth later that year and strengthening into 2015. However,

we are forecasting a recovery from weakness, rather than any real strength, and the upturn is not expected to be sustained. Due to this, and also because we believe global demand will be slightly negative in the long term, we are then predicting a modest drop in paper demand in 2016.

Separate from the cyclical shape of our forecast from year to year, the major long-term structural influences on paper demand (e.g. competition with electronic media, environmental/budget-related consumption cutbacks, etc.) during the forecast period are negative in the mature markets. Because the mature markets are (for now) generally larger than the emerging markets, we expect this negative influence to outweigh growth in the emerging markets, most of the time.

We take a look at some of the long-term demand factors on the following pages.

8.4.2 Loss Of Users progression



One of the regions structural impacts on paper demand is deliberate consumption cutbacks aimed at cutting spending, while both businesses and administrations claim the lower consumption means better sustainability. We call this the "Lean & Green" effect.

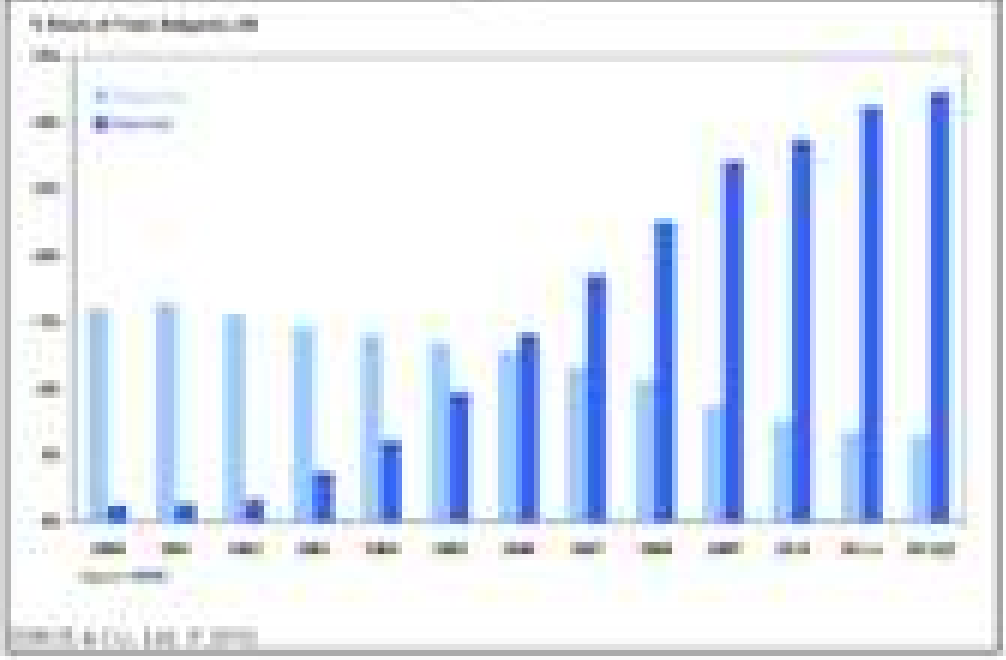
This is mainly an issue in developed markets, and is mainly affects office papers and mail volumes, so especially Uncoated Woodfree Reels and Cut-Size, as well as some Coated Woodfrees (in mailings). The technological developments that have made such cutbacks easy include new-sided printing being the widespread default setting on modern copiers and printers, while marketing and billing mailings can easily be replaced by email bills or PDF downloads from emails and Cloud-based sources.

Our research suggests that this process will has the potential for significant further reductions in corporate/institutional paper demand, and we expect this to be a continued major concern for demand in mature/developed regions in the long term.

4.4.3 Competition with electronic (or New) media

FIGURE 24: MAGAZINE vs. INTERNET: SHARE OF TOTAL ADSPEND

UK



Our forecasts in this World Graphic Paper report also factor in negative effects of competition with electronic media. We have frequently discussed the effect of electronic storage of documents on computer hard drives instead of printed files, transmission of emails to billing instead of letters/faxes, advertising on and consumption of news/ entertainment, etc, on the Internet instead of magazines, as well the use of advertising on console and computer games and mobile phones – trends which are now well established.

This is especially the case in mature markets, but in the longer term, we expect to see these influences becoming gradually more important in developing markets also, in line with more widespread high-speed internet access.

There are new forms of electronic competition that we will take a closer look at here, however, as they are on the verge of new breakthroughs – one in terms of penetration (e-readers/tablets) and one in terms of how it is used (B2C transaction on social networking websites). We will consider e-readers/tablets in this section, while we felt that the potential explosion of B2C social networking merits its own [Continued]

E-readers/tablets

We have already discussed the effect of e-readers/tablets, such as the Amazon Kindle, Apple iPad, etc. on Magazines in previous reports. However, with the 3rd-generation iPad just launching as we go to press and the Kindle Fire having launched last last year, this is a sector that looks set to expand on its already rapid growth.

First, some context of where we are today. Despite the rapid growth to date, global sales of e-readers/tablets are not yet anywhere near as widespread as other screen-based media, such as PCs and laptops. Globally, Apple sales of the iPad reached 55 million by the end of 2011, and the device is believed to have a share of somewhat more than half of the tablets market. If we roughly estimate total global penetration of e-readers/tablets at 100 million devices or so, it is clear that tablets/e-readers still have a long way to go to rival other media (e.g. print media are used by billions of people worldwide, as is television, both of which dwarf the current reach of tablets/e-readers).

This may be one reason why the current evidence suggests these devices are not (yet) having a massive impact their print counterparts, even in mature markets. The German market is a prime example. German magazine advertising grew last year, on the whole. And although German magazine circulation has been falling by around -1.5% to -2% for the last two or three years, this is actually little more than a continuation of a trend that began many years before e-readers and tablets arrived.

Apart from the comparably limited spread of e-readers/tablets so far, there is another possible explanation for this – surveys suggest that users generally do not like the e-reader/tablet versions of magazines in their current forms. However, the more widespread these devices become, the more we would expect publishers/technology firms to develop versions that consumers increasingly do like. And in the 3rd iPad/Kindle Fire phase, further strong sales growth is expected for tablets in the short-term. Longer-term, we expect their use will indeed become truly widespread, especially when the cost of e-readers/tablets falls far enough.

As we have said in previous World Graphic Papers reports, we have no doubt that e-readers/tablets will take market share away from printed media, although we do expect the down to remain a relevant medium for some years. We include a moderate negative impact from e-readers and tablets during the forecast period, rather than a collapse, affecting Uncoated and Coated Mechanical Papers and to a lesser extent, Coated Woodfrees. This will especially be the case in those markets where e-readers/tablets are most popular (e.g. North America in particular, but increasingly in Western Europe).

When it comes to the impact of e-readers and tablets on printed media, it is actually printed **books** that **are far more under threat**. There have already been double-digit

losses in printed book circulation in some markets in 2011 and more expected, but all these developments are already recognised and built into our existing forecasts.

In the printed book sector, sales of printed books fell last year in at least the UK, Spain and Ireland (according to Nielsen BookScan), but we believe this was also the case in many other European markets, too. In the UK specifically, the number of print books bought in 2011 fell by 13%, according to Nielsen BookScan data, and that continued in January with a further drop of -12% in the first four weeks of the year. Nielsen BookScan commented that much of the decline is being widely interpreted as the impact of sales moving over to e-books, especially in the Adult Fiction segment.

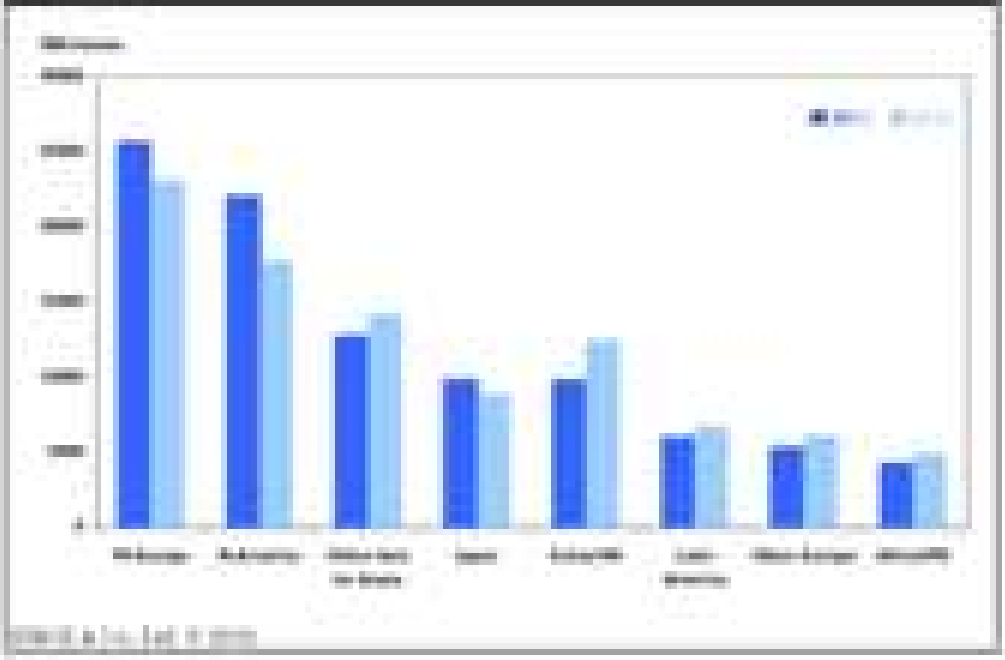
However, although the printed book sector is suffering badly, other areas of print are proving more resilient, as mentioned, and there are even some areas of growth or potential growth (e.g. colour printing, mobile printing, multi-media channel marketing). Our long-term view is that print's share of the media market will erode fairly gradually, rather than collapse suddenly.

Emerging Markets

A further upside a print media growth in several emerging markets, as we detailed in the earlier section on China and India, for example. This is despite very strong growth in New Media uptake, with countries like Korea seeing an phasing out printed school books in favour of cheap electronic tablets, towards the end of our forecast period.

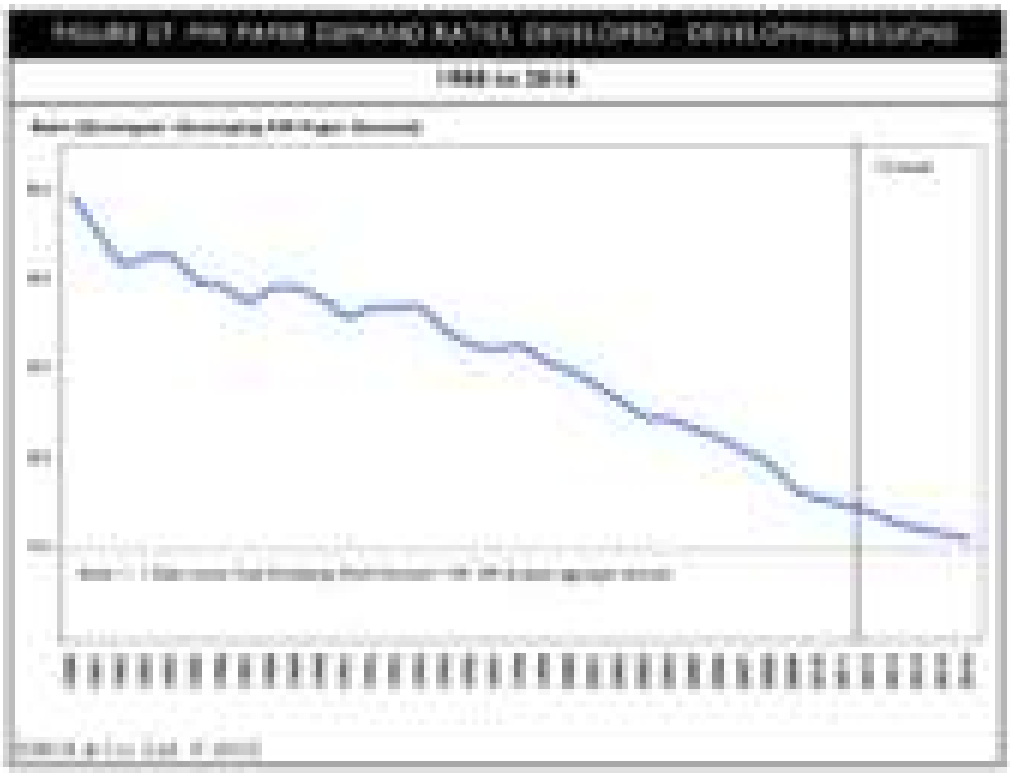
Competition with New Media is expected to impact consumption of printed media in emerging markets, but with price currently enjoying double-digit growth in several markets with increasingly narrow middle classes with rising disposable income, emerging markets are still predicted to be a source of paper demand growth throughout the forecast period (see charts).

FIGURE 34: GLOBAL PAPER DEMAND BY REGION – 2011 vs. 2014



Paper demand growth in emerging markets is, however, forecast to be outweighed by declines in mature markets (which accounted for 60% of global paper demand in 2011) in the long term.

Hence our forecast that the downturn in mature markets will slightly outweigh growth in emerging markets, adding up to a slight downturn in global long-term paper demand (-0.4%pa for 2011-2014e).



Looking at the inter-regional impact of these developments, our forecast of demand growing in emerging markets but declining in mature regions is expected to accelerate the West-to-East shift in the power base of the global paper industry.

Since the year 2000, for example, the combined mature market bloc of North America, Western Europe and Japan have seen their share of global paper demand fall from 75% to the current 60% (down from 67% a year earlier), while their share of global paper capacity has declined from 75% to 63% (down from 66% a year earlier).

According to our current forecasts, these shares will fall further to 53% of world demand and 57% of global capacity by 2016.

Looking at the West-to-East shift over the last 3 decades, the dominance of mature markets has seen their share of demand fall from a 3:1 ratio (developed vs. developing markets) to well below 2:1 now. And this is forecast to fall almost to parity (1:1) by 2016.

BLANK PAGE

4.5 Demand: Current

How far will social networking expand past mere advertising?

In past World Graphic Paper reports, we have examined in detail the effect of exploding on-line advertising expenditure, and the consequent losses of adspend on traditional media, including print media. We have long expected print to continue losing advertising market share, and such future losses have already been included in our forecasts for paper demand for some years now.

However, there are new potential threats to traditional media, apart from simply on-line advertising. We would like to examine two of what we currently perceive to be potentially major future challenges for both advertising income and reader numbers:

1) Consumer/company interaction on Social Network Media. By this we mean companies engaging with self-declared customers/fans directly, and in some cases even entering into direct dialogues with them on social network sites, especially on Facebook.

2) User-generated endorsements/recommendations of products/services on Social Networks, especially sites like Pinterest, as well as Facebook, Twitter, etc.

The current clearest threat in terms of advertising appears to be #1, i.e. Facebook. In the longer-term, #2, i.e. user-generated endorsements/recommendations also have the potential to be a major influence on marketing spend.

1) Consumer/company interaction on Social Network Media

According to Comscore, a company that monitors and measures Internet activity and audiences, the reach of Social Networks like Facebook, Twitter, Google+, LinkedIn, Pinterest, Baidu, etc. has been growing dramatically in recent months and is now around 90% of Internet users in most European countries, and even higher in some, with the estimated average for Europe being above 90%.

And Facebook is the clear leader of the pack, with over 800 million active users worldwide, including an estimated 250 million unique visitors in Europe alone. And although penetration is lower in other countries and regions (Facebook so far reaches only 20-30% of Internet users in India and Brazil, for example), the numbers of users in those two example countries doubled and tripled in 2011, as the penetration is expanding rapidly. (China is an exception, because Facebook access is restricted in that country). And Facebook is succeeding in turning its reach into revenue - according to eMarketer, Facebook's global advertising revenue is expected to double to US$3.8 billion this year alone.

It is not the growth of user numbers that we consider a potential threat, however – after all, if most of the population is already on-line and the reach amongst these people averages more than 90% already, then there is limited scope for further growth. Having said this, we do assume some continued loss of time spent consuming print media by each user, and these losses are already part of our existing forecasts.

Quite apart from this, though, we believe the potential new threat is in how Facebook itself is developing. In 2011, there was a dramatic rise in the amount of interaction between companies and consumers on Facebook. This resulted from consumers volunteering to receive communication from companies, either by clicking "Like" on the company/product/service page on Facebook or simply by the consumer listing the company/product/service as something they like on their general profile. Already, the brand Coca-Cola has around 40 million Fans of its Facebook page, growing by around 10 million in just the past 3 months.

The preferences of these fans are then communicated to the people in the user's network ("Friends"), which encourages more users to click "Like". Some companies have also now chosen to use their Facebook page to accept direct communication from consumers, often setting up a two-way dialogue between consumer and company (although such companies remain a small minority, so far).

Despite Coca-Cola's millions of fans, this is actually still in the embryonic stage, and we do not doubt that there will be a considerable upsurge in this type of B2C communication/marketing/advertising via Facebook in particular (and possibly other social networking websites, if they can develop similarly-attractive functionality). There is a clear benefit for businesses in creating a positive image, as well as giving valuable direct access to consumers, for communication of whatever messages a company wants to pass on (e.g. marketing, advertising).

However, while all the successes sound great, we caution against getting caught up in the hype immediately. There are actually many reasons why this might not have a massive impact, but perhaps only a moderate influence, on advertising in other media. There is a great deal of research, for example, showing that many companies are not using this opportunity very well, and are actually annoying consumers, rather than engaging them positively. In addition, not all companies have the opportunities that a company like Coca-Cola has, to use of this as a communication opportunity. For example, many companies/products/services are what is known in the advertising world as "low excitement" (i.e. boring) brands, which will often find it difficult to gain, e.g. Facebook fans.

Another reason why we are not immediately assuming this will be a huge revolution is the type of consumers who make up Facebook's core user base. True, the overall membership is very broad, but there is a difference between the types of people who use

a regularly – and follow all of the news and updates from all of their "friends" and "Liked" companies – and the type of people who only log in occasionally to check their messages and who rarely look at news or updates. As such, it is not at all clear whether the consumers that companies want to access are actually on Facebook often enough for it to be a very effective marketing medium.

Despite these challenges, the potential upsides for companies using Facebook (and potential downsides for print advertising) cannot be ignored.

Even if B2C interactive marketing/communication on social networks turns out only to be useful for some types of companies to reach a limited audience effectively, this will still require manpower and therefore budget to be allocated to this activity. Which means that spending might need to be cut from other marketing/advertising activities at times when budgets are tight. And if a Social Media marketing turns out to be extremely successful, then businesses might even switch money from other marketing/advertising efforts to support their social networking marketing even at times of healthy profits when budgets are more generous.

We mentioned earlier that Facebook's massive success with users in the developed world means that it is less of a future threat to print in terms of losing readers/users, as it has already achieved a far-reaching audience penetration. In emerging markets, there is perhaps greater potential, but there is actually no convincing evidence that the growing middle classes in countries like China, India and Brazil, etc. are "leapfrogging" print media to go straight on-line, while ignoring print. Indeed, print media in all of those named examples are seeing advertising growth rates in double-digit percentages, which suggests a strong future on the short to medium term, at the very least.

A Uber-perceived collaborative recommendations of products/services on Social Networks

Back in the mature markets, though, there is another type of potential new threat to print. In the case of printed magazines, we see a potential major threat from Social Networks which revolve around content/link sharing, such as Pinterest. The theory being that if people can find a Social Network which gives them much of what they currently get from print media (or something just as good), then the print version would be at risk. This applies both to editorial content and to advertising – users are not only providing/linking to content that interests and entertains (i.e. competing with editorial content of magazines and other media), but they are also recommending products and services (competing with advertising in magazines and other media). **Effectively, the power of communication is increasingly moving towards the user.**

A prime example is the Pinterest website, which, as mentioned earlier is a content/link sharing site and which is growing fast. And there is a risk that this and other social

research websites could potentially be a major threat to consumption of both editorial and advertising in print, as well as other media. The threat is that such sites would result in peer generated content emerging as consumers' prime source of information/entertainment.

This would not only impact consumption of magazines (and other traditional media), but even more fundamentally, it could reduce the effectiveness of advertising, as consumers react less and less to non-peer communication (e.g. adverts), increasingly focusing on the communication they from their peers. Currently, businesses can orchestrate an advertising campaign to get their messages out, but if consumers increasingly use each other (e.g. personal endorsements and viral messages on Pinterest etc), rather than adverts, to find out what new things are exciting, interesting, valuable or good, then traditional advertising could potentially become less powerful.

Interestingly, although this is obviously a potentially big threat, it is also potentially an opportunity. Because if advertising becomes less powerful, we could imagine companies reacting in two different ways. On the one hand, they could decide it is not worth wasting money on traditional advertising, if consumers are listening more to each other than to advertisements. On the other hand, advertisers may feel there are no obvious alternatives (we have already discussed the potential limitations of marketing/communication via social media), and react by advertising more, probably with multi-channel campaigns, just to have the same effect as before. This could well benefit printed direct marketing.

To summarise, social networking media could be about to start a new expansion phase, in terms of engaging businesses, although it is too early yet to know whether this will actually happen in a big way. At this early stage, it is difficult to distinguish between hype and reality. It has yet to be established how effective and valuable Social Networks marketing will be as the advertisers/marketers, how much companies are likely to spend on it and how this might affect other parts of their media spending mix. We hope these developments will soon become clearer. For now, though, it is impossible to distinguish whether this is just part of the established trend of Internet and Online Advertising (already factored into the EMGE paper demand forecasts), whether it will add further downward pressure to the existing negative demand trends, or even indirectly contribute somewhat to paper consumption.

To analyse the impact effectively, we will also need to observe the real impact on spending on other media, too. For example, despite all the hype about Social Networks in developed markets, Germany still reported growth in print magazine advertising last year, so we will need to see some clearer evidence of how much print is likely to lose out.

And as mentioned above, there is just a chance that this could just be an opportunity for print, too.

B.1. Supply – Base Capacity

Without additional closures, capacity will rise as demand falls, worsening overcapacity

Asia Total	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]

[illegible]

Based on known plans and projects both for capacity increases and closures (i.e. what we call **Base Capacity**), global Printing/Writing paper capacity is projected to be broadly stable or increasing throughout our forecast, with expansions mainly in Asia counter-balancing or outweighing closures in mature markets.

Over the whole forecast period to 2016, global Printing/Writing paper capacity is projected to grow by a net total of almost 2.4 million tpa, i.e. an average annual rise of 0.4%.

This is considerably lower than our last forecast, due to more new capacity closures announced particularly in mature markets. Nevertheless, the net effect is 2.4 million tpa of capacity increases planned in a paper industry that already suffers from overcapacity and can no longer rely on long-term demand growth. This highlights the challenge facing the industry to close even more capacity still. Otherwise, global Printing/Writing Operating Rates could fall to 83% (see page [illegible]). As painful as even more closures will be, the huge volume of cutbacks announced recently suggests that the industry is committed to tackling the issue.

FIGURE 27: CAPACITY GROWTH TRENDS – BASE CAPACITY

Based on currently known plans, global P/W/I paper capacity is mostly projected to fall marginally this year. However, less capacity is expected to grow again in 2015 and by smaller amounts in the subsequent years.

Of the total 3.4 million tpa base capacity increase to 2016, regional differences are shown below, which make it clear why the vast majority of the world's capacity increases will take place in China.

FIGURE 28: CAPACITY INCREASE BY REGION – BASE CAPACITY

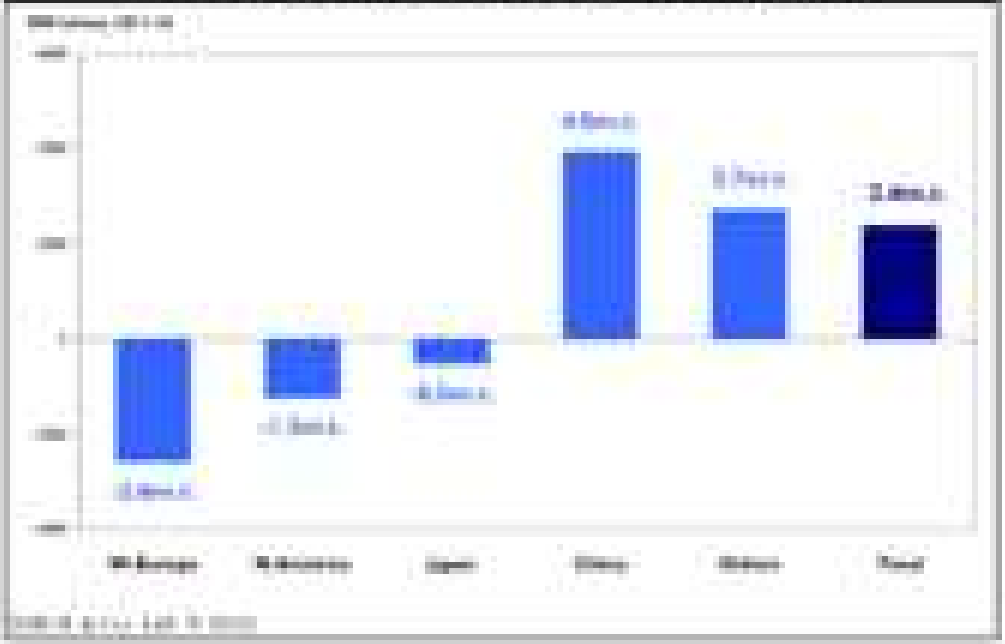

FIGURE 11: GLOBAL MAJOR PAPER OPERATING RATES – BASE CAPACITY

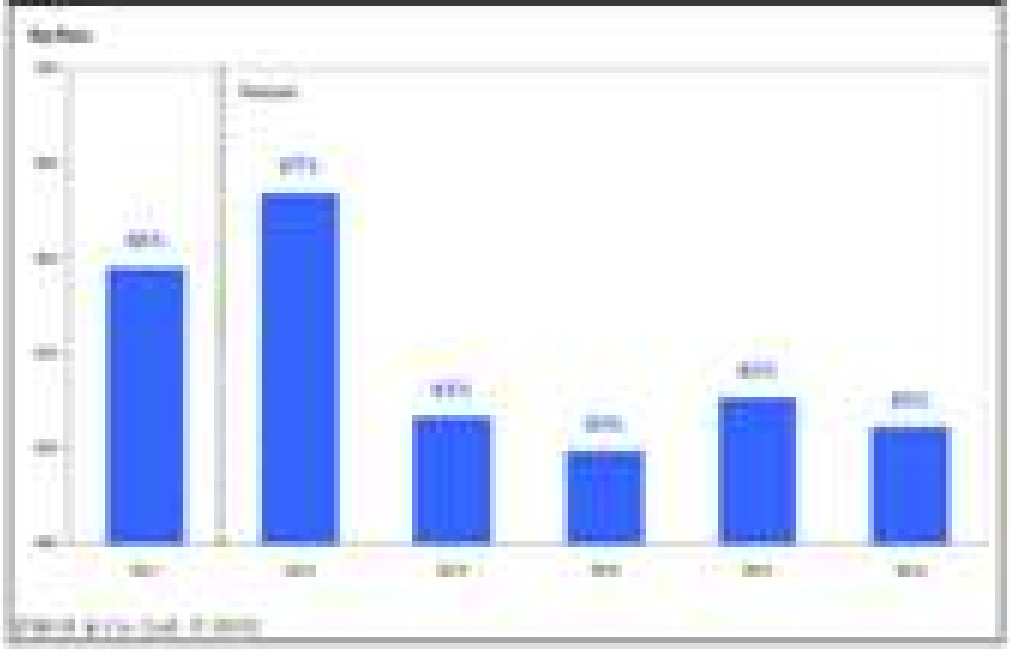


With one drop in global demand forecast to slow this year, while capacity will fall, world Printing/Writing Operating Rates are forecast to average 87%, up from 86% last year. However, worse is forecast to follow, unless there are more big capacity closures. This is especially the case in 2013 with global paper demand forecast to fall by -4%, while base capacity is closed to rise by +1.4%.

Combining our demand forecasts with the **Base Capacity** projections outlined on the previous pages, the result would be **global** (and at times, severe) **overcapacity throughout the forecast period.** In fact, according to our Base Capacity projections, Operating Rates would average below 84% in every single forecast year after 2012.

Having said this, with almost 3 million tpa of new closures announced (up in the space of time since our last report (which follows 3 million tpa of closures announced in the previous 6 months), we are forecasting that the industry will continue to succeed in coming up with further major capacity cutbacks during the forecast period. Counter-balancing this, we also predict some more investments, too, over and above those that have been confirmed to date, especially in Asia. Our forecasts for these additional investments and closures are added to the Base Capacity to produce our *Forecast Capacity* (see following section).

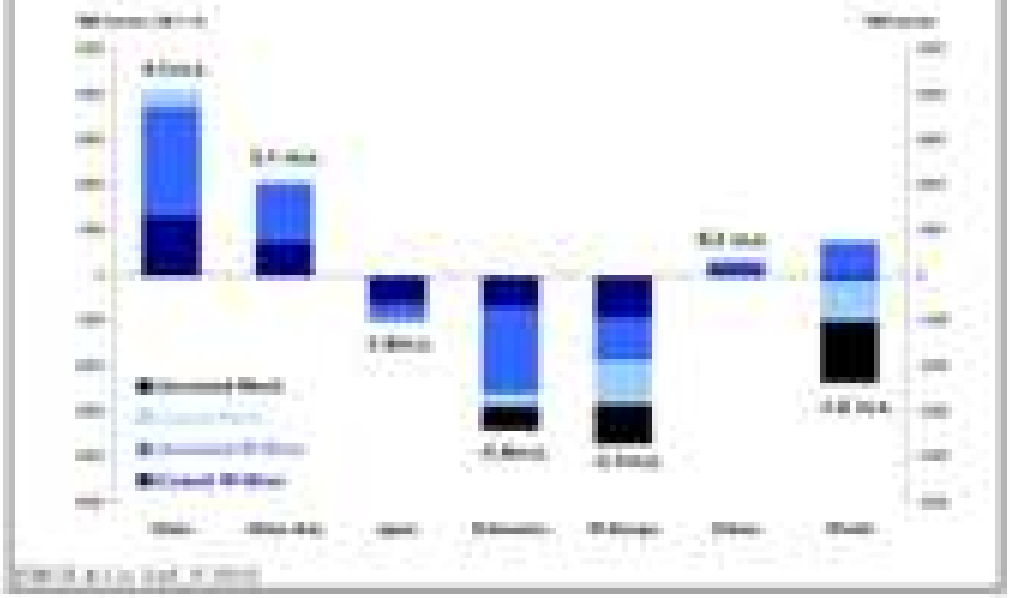
BLANK PAGE

B.2. Supply – Forecast Capacity

Additional closures to the West likely to build more and close more

FIGURE XX. CAPACITY ADDITIONS BY REGION

Regional Capacity Increases, 2014 over 2011



The Base Capacity projections do not include any additional Unspecified Capacity closures the papermakers may implement to reduce overcapacity. The section of our Supply analysis assesses both **Base** and **Unspecified Capacity** together, to result in EMGE's **Forecast Capacity**.

Unlike the Base Capacity projections, which are based only on what is currently known, our Forecast Capacity makes certain assumptions using our analysis and understanding of the paper industry.

Combining both known and predicted investment/closures, our Forecast Capacity shows large capacity growth in Asia being outweighed by closures in mature markets. This adds up to a global Forecast Capacity decline of -1.6 million tpa by 2016.

The net reductions in Printing/Writing Paper capacity over the forecast period amount to -2.7 million tpa in W. Europe, -3.4 million tpa in N. America and -1 million tpa in Japan, alongside net growth of 4.1 million tpa forecast in China, focused on Woodfree.

This involves several assumptions by EMGE about Unspecified investments and closures, which are summarised on the following page.

FIGURE 11: CAPACITY – UNDERLYING CHANGE (PE/WE PAPER)

Source: RISI, Inc. | Jan. 27, 2012

For this forecast, the main assumptions (over and above what is currently known) are:

- The markets with the weakest forecast demand will see significant additional capacity closures (see table).
- We are also predicting considerable capacity closures in Asia, where we expect some new machine investments to replace older (relatively) uncompetitive capacity, as growing capacity outstrips demand.
- However, we are also predicting additional ("Unspecified") investments in Asia. These are broadly expected to balance out the predicted additional closures in the region.
- These, plus the investments already confirmed, will hugely outweigh the predicted Unspecified closures globally, so our forecast is for substantial net capacity growth on a worldwide basis.

The combination of our predicted Unspecified investments and closures add up to a net 4 million tpa of capacity closures over the next 5 years, over and above the reductions that have already been announced. We realise that this sounds ambitious, but the industry has

announced around 5 million tpa of closures in just the past year, as papermakers have already demonstrated that they are firmly committed to this process.

Regarding timing of the closures, we expect a ramping transition to the predicted peak reached in 2013, with large-scale capacity closures predicted in both 2013 and 2014.

All of the confirmed and Unspecified investment/closures add up to our Forecast Capacity (Base plus Unspecified) change (see below).

FIGURE 24: FORECAST CAPACITY CHANGES BY REGION (2011 -14)

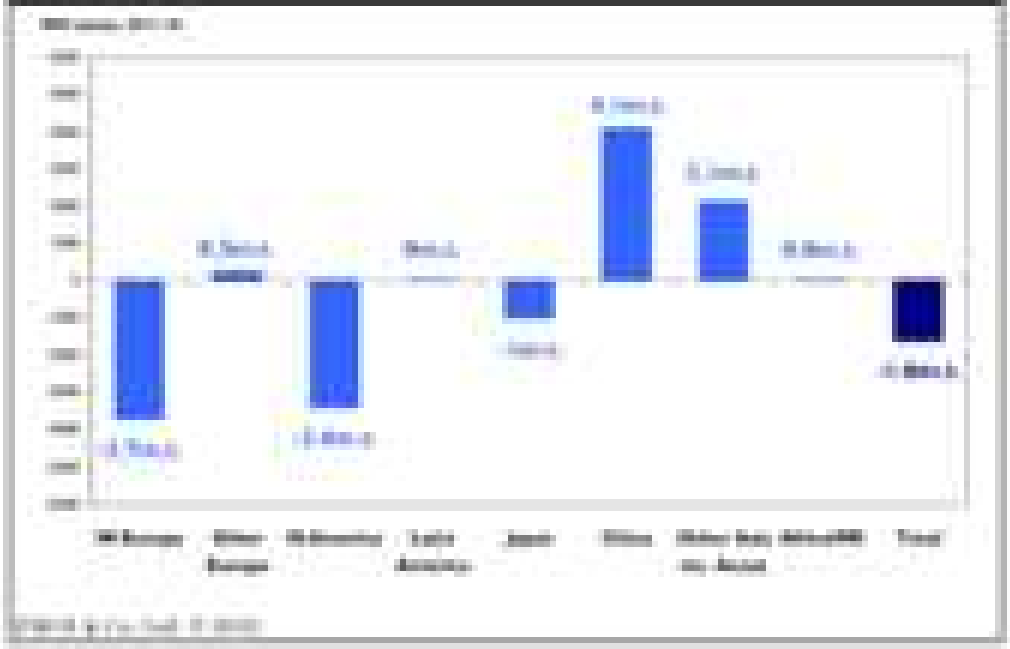

FIGURE 25: FORECAST CAPACITY GROWTH TYPICAL

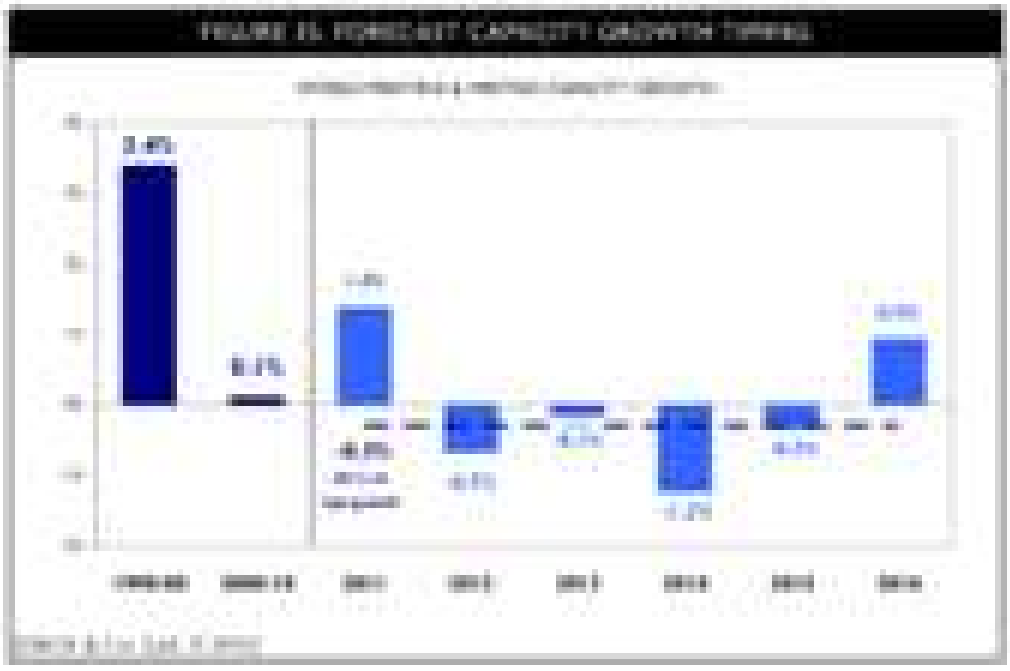

FIGURE 5a: DEMAND VS CAPACITY GROWTH (2011 – 16)

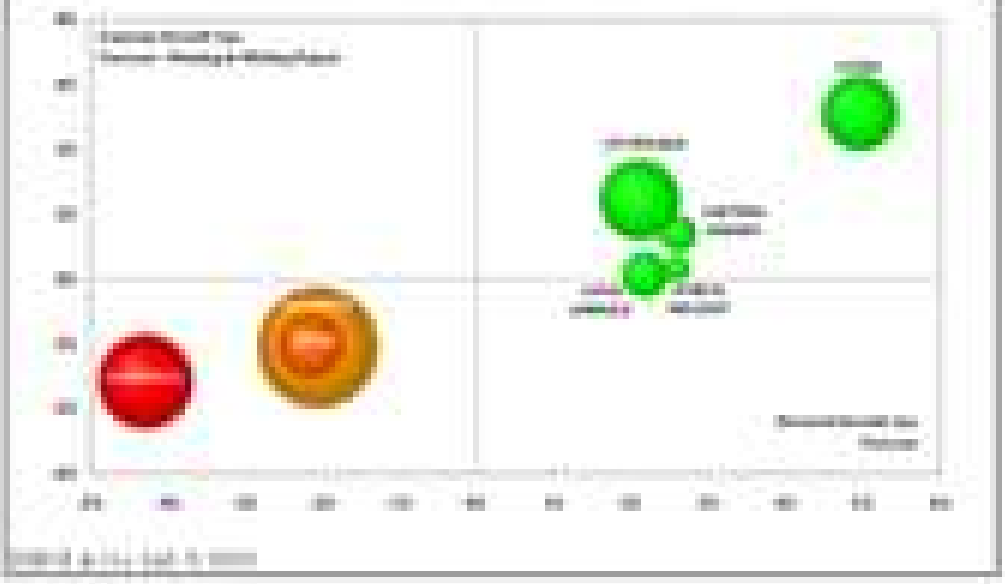

We are forecasting this capacity will fall in the regions where demand is also predicted to fall, i.e. North America, Western Europe and Japan (see chart).

Because previous closures have reduced the number of remaining, small, older paper machines in Western Europe and North America, the future closures that we are predicting in those regions will be especially painful for papermakers. To keep the remaining capacity competitive enough to withstand competition from overseas, papermakers in these regions may be driven to further consolidation, in sectors where that is not yet prevalent (see page two).

Meanwhile, on top of the many confirmed capacity investments in Asia, there is also a long list of unconfirmed expansion projects, especially in China and India (see following pages). We are predicting that a portion of those will switch from unconfirmed to confirmed during the course of the forecast period, further adding to the forecast capacity additions. These additions are expected to cause heavy oversupply in some cases, prompting the closure of a considerable volume of older, inefficient capacity.

SOURCE: [illegible]

India has been investing rapidly in new capacity and we are forecasting that the country's need to import paper will fall, especially in the Uncoated Woodfree sector.

There are firm projects to add almost 4 million tonnes of new capacity in India. In addition to those, the list of planned but unconfirmed projects in India totals another million tonnes, over and above those included in our forecasts (see table). International Paper's entry into the Indian market is expected to push that process forward in the medium term (although the company has not announced any major investments so far).

However, we do not expect India to become a major exporter of paper in the short to medium term, because the producers are focused mainly on serving domestic demand (e.g. Indian demand for Cut-Size papers is growing by double-digit% percentage rates).

FIGURE 2A WORLD P&W/P&W CAPACITY GROWTH

Capacity Growth, P&W Papers (% pa)

Global P&W capacity growth has already slowed from 1.4%pa during the 1990s to virtually zero in the new millennium. Our Forecast Capacity actually sees global capacity decline slightly (-0.2%pa on average) over the 2011-2014 period, with capacity growth in Asia being marginally outweighed by closures in mature markets.

The combination of net capacity growth in non-Japan Asia and declines in mature regions will accelerate the migration of papermaking capacity from "West" to "East", and our forecasts is for the large mature markets (North America, Western Europe and Japan) to see their share of global capacity fall from 43% in 2011 to 37% by 2014.

These developments will also have a direct effect on the balance of inter-regional trade – see "Trends" section, which follows on Page 11.

Our global capacity forecasts by paper grade are shown in the table below. These indicate broadly stable Woodfree capacity, while Mechanical Paper capacity is expected to fall slightly. This is largely due to Asia investing mainly in Woodfree capacity, while closures will be focused on Western Europe, which dominates Mechanical globally.

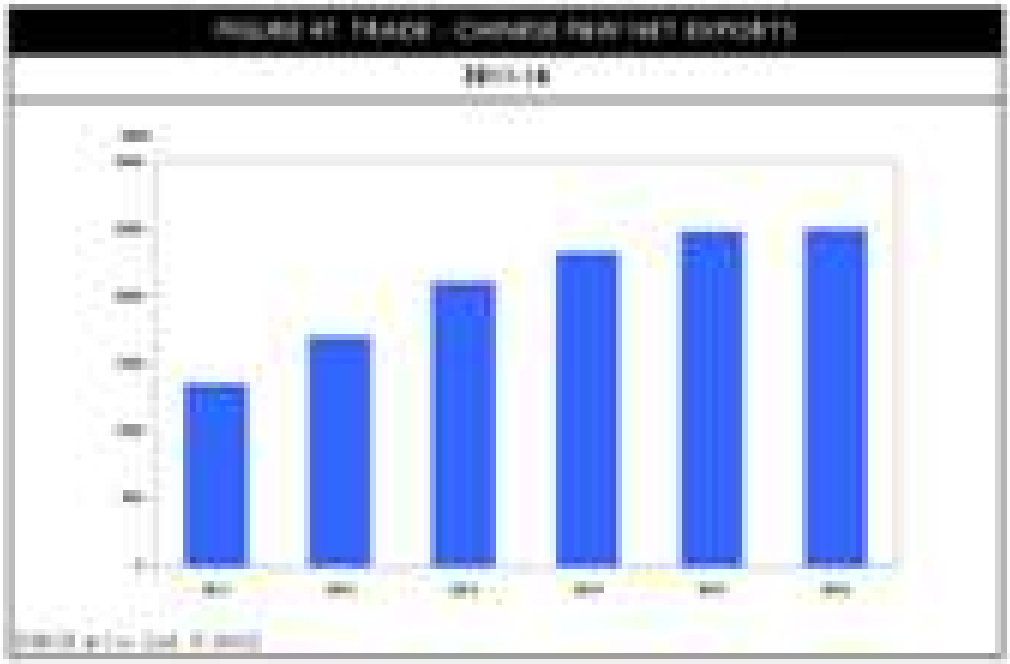
C. World Trade

China to become net exporter of UWF, as well as CWF



We mentioned in the previous Chapter that mature regions are expected to close capacity in line with declining demand, but that Asian capacity would rise more rapidly than demand. This is especially true for China, where heavy overcapacity is expected to develop.

China has already transformed itself from an importer to a large-scale exporter of particularly Coated Woodfrees in recent years, although it has not yet become a net exporter of UWF. Increasingly, however, the capacity investments in China are favouring on Uncoated Woodfrees rolls now. Considering the country's track record as a developing paper exporter, as well as the predicted oversupply of Uncoated Woodfrees on the domestic market when new capacity comes on stream, we predict that China will be exporting well over 600,000 tpa of Uncoated Woodfrees by 2016, mainly to growing emerging markets. This will be alongside more than half a million tonnes of forecast growth in net exports of CWF, over the same period, pushing the country's total net exports of thWFs papers from 1.4 million to 2.5 million tpa by 2016 (see above chart).

There is also a potential upside risk to China's UWF export outlook, as there will be ample spare capacity for exports a lot more than we are forecasting. However, we expect it will take some time to develop its Uncoated Woodfree export business.

C.1 World Trade – by Region

Net trade equates to Net Exports (i.e. the balance between Exports and Imports)

China's expected to retain parity in Woodfree paper exports on the growing converging economic symmetry at the expense of Western Europe.

At the same time, Western Europe is expected to start recovering until to the Woodfree paper trade, to come a downward gradient.

FIGURE 44: TRADE – WORLD PRINTING NET EXPORTS BY REGION

2011 vs. 2014

In addition to growing Chinese Woodfree exports, capacity investments in India are also predicted to affect global trade, as India will become less dependent on imports.

These factors will all have an impact on Western Europe, which is forecast to lose out somewhat in global trade of paper, as it misses capacity to minimise overcapacity, and as China exports more (and India imports less) Woodfree Paper. Despite this, Western Europe is predicted to remain by far the world's dominant paper exporting region, especially in Mechanical grades, where it is the clear world leader, with growth prospects in developing markets (as mentioned strong growth in the negative sections of developing markets earlier in this report). Western Europe's net trade balance, then, is expected to fall from 7 million tpa of Printing & Writing papers in 2011 to 6.9 million tpa in 2014.

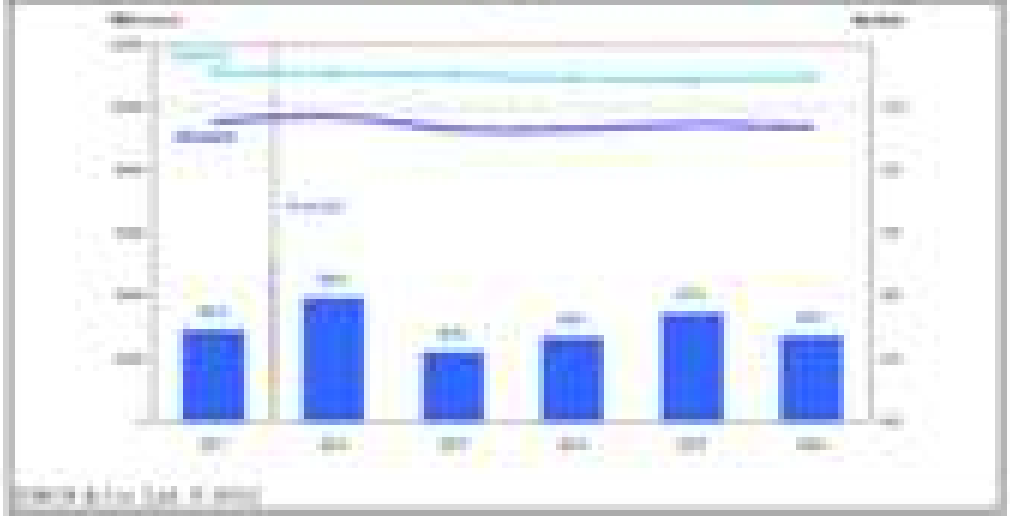
Globally, trade flows are expected to increase between exporters and the growing emerging markets where capacity is not increasing very rapidly. In contrast, we predict that it will become increasingly challenging to export to mature markets, due to forecast falling demand in those regions.

D. World Supply–Demand Balance

Additional capacity closures not expected to prevent oversupply

FIGURE 14: WORLD GRAPHIC SUPPLY, PRINTING & WRITING PAPERS

Demand-Supply Balance



As we explained in the *Forecast Capacity* section earlier, even the massive volume of mill and machine closures that we are forecasting (4 million tpa) over and above those that have already been announced will only result in a marginal drop in global capacity over the forecast period. This is because new capacity in Asia is forecast to balance out future closures, both in Asia itself and in mature markets.

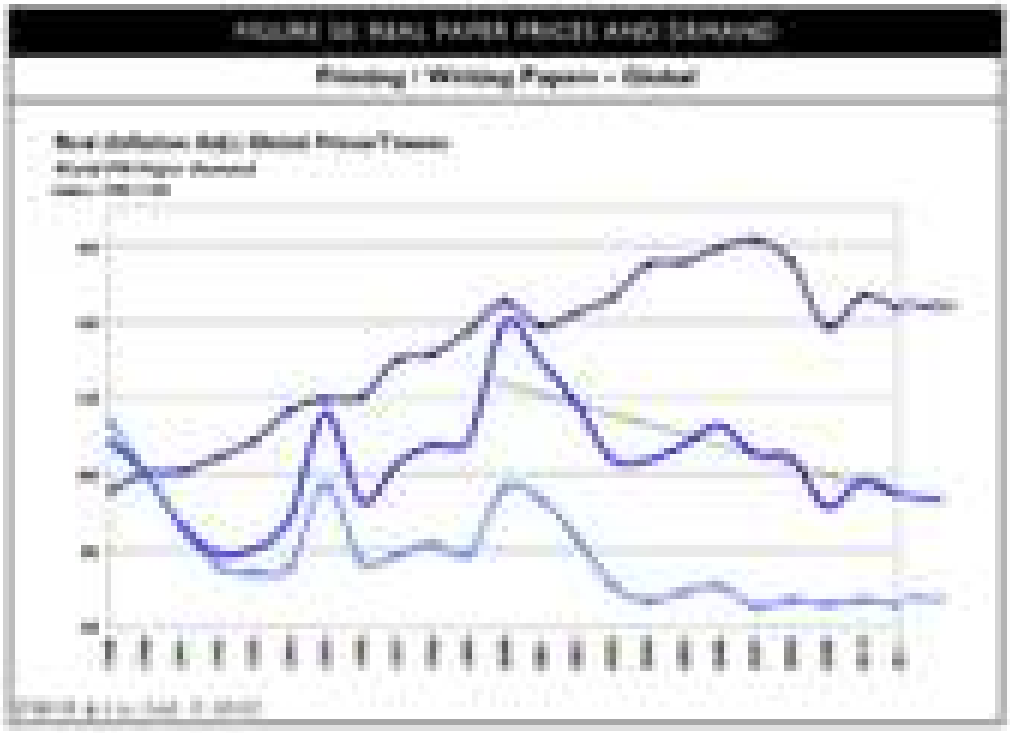
We are forecasting an average drop of -0.3%pa in capacity, while global demand is predicted to decline by -0.4%pa, an average continuing the general trend of paper makers closing capacity in line with falling demand mainly in mature markets. So with capacity and demand forecast to fall by similar volumes, the current overcapacity is expected to persist throughout most of the forecast period, although this does not exclude the possibility of temporary periods of balanced supply and demand. On an annual average basis, operating rates are predicted to vary from 84% to 87% during the forecast period (see above chart).

If the additional capacity cutbacks that we are predicting do not take place, then there is a serious risk of even heavier oversupply on the global level. However, large volumes (almost 3 million tpa) of new closures announced since our last report (and around 5 million tpa sold in the past year) suggest the paper industry is firmly committed to reducing capacity in line with drops in demand.

BLANK PAGE

E. Prices & Value

Value is back on long-term trend



The above chart shows the historical development of Demand, real (i.e. inflation-adjusted) Price and Value, all on a global basis. The term "Value" here relates to the sector's apparent Revenue (expressed here as an index, and adjusted for inflation), calculated as Value = Price multiplied by Tonnes.

The "Value" of paper (i.e. the total apparent amount of money spent on paper) has moved from an upward trend in mid-1990's to a declining trend since the start of the new millennium.

We have argued in the past that the declining Value trend showed that the market was no longer willing/able to increase the total budget spent on Paper overall, regardless of how much paper (tonnes) it uses. We also argued that if paper users were no longer prepared to pay more for paper, then there would, in time, be a downward revision in demand when prices rise (i.e. Price/Demand Elasticity). This remains a downside risk for paper demand.

BLANK PAGE

F. Industry Consolidation

Surviving industry in mature markets is leaner, more consolidated

FIGURE 31: EMGE INDUSTRY CONSOLIDATION SUMMARY

Magazine Papers	1 270	1 720	883	740

* figures in bold indicate active or "highly consolidated", as does a NAFA figure over 1800

EMGE & Co Ltd, © 2013

In the mature regions of North America and Western Europe, the level of paper industry consolidation is generally moderate to high. With the exception of Europe's Woodfree sectors, the "Western" paper industry is close to or above the associated N-1800 level of 1800 in all sectors, which would traditionally indicate that they are highly consolidated.

However, we believe mergers and acquisitions are likely to be on the agenda for more and more companies in the coming years. As more machines sit idle, the remaining companies will consist of fewer and fewer production units, meaning that further closures could end a company's existence entirely. We believe that, if any, companies will voluntarily step out of the industry, preferring to be bought out to pursue a merger instead.

In North America, there would appear to be little scope for further consolidation in Coated Woodfrees as that sector is very highly consolidated already. However, earlier mergers in North America have suggested that deals may still be possible in the Uncoated Woodfree and in the Mechanical Paper sectors.

In Europe, meanwhile, we have already argued that Mechanical Paper mills are likely to benefit from growing magazine businesses in export markets which do not produce Mechanical Papers themselves. However, a moderately declining domestic business is still expected to claim more victims. Theoretically, a defensive merger should be unlikely in the highly consolidated Uncoated Mechanical sector, but if the authorities are prepared to

consider all Mechanical / Magazine Papers as a single sector, then there could still be room to manoeuvre.

It is the European Woodfree sector where consolidation seems much riskier, however. For one thing, it is in Woodfrees that export markets are expected to get tougher for European mills, largely due to Asian capacity expansion, as explained earlier. In addition, domestic demand is also under pressure, due to a range of factors, as explained in the Demand section of this report. At least as important as these factors is that Europe's Woodfree Paper industry is fragmented, and there is clearly room for mergers/ acquisitions – especially in Uncoated Woodfrees, which will come under increasing pressure from the upcoming wave of new Asian capacity.

When the new Asian capacity comes on stream, we do not expect it will just be Western machines that will come under pressure, however. Following large-volume capacity closures and strict cost-reductions, the surviving (larger, more modern) machines in the West are more efficient than they have been for years. The same process has begun, e.g. in China, with large numbers of very small mills being closed, but we believe much capacity still remains that will prove to be uncompetitive when the new Asian capacity creates heavy regional overcapacity. The closures of such mills/companies are expected to raise the level of consolidation in those markets, although in comparison with mature markets, the industry in Asia will remain highly fragmented for some time, we expect.

Pricing & Demand

We will briefly repeat here a warning that the increasingly consolidated paper industries in Western markets carry a downside demand risk. More consolidation may help Western papermakers to raise prices when demand is poor and the market oversupplied (usually when costs are rising), but pushing through price rises when paper consumers are suffering falling demand carries **an even greater downside risk in terms of long-term paper demand volumes.**

6. Newsprint - Forecasts

World Newsprint Markets (WNM) – SPRING 2012

In order to focus more on the specific issues of the important Newsprint market, we are pleased to announce the upcoming publication of an update to our associated report "World Newsprint Markets" (WNM).

The WNM report is published in two parts:

1) Supply-Demand Outlook, 2011 to 2016 (including capacities and leading supplier tables)

2) Price Forecasts – quarterly and 4-year outlook for Newsprint and Publication Paper prices around the world.

In the next issue of WNM, the report will examine the key developments that are likely to impact the future market, including price forecasts, demand-supply, outlook etc.

For more information on the World Newsprint Markets report, please contact:

EMGE & Co. Ltd.

8. Supply Outlook

Detailed information on our capacity calculations

This report includes detailed capacity information, to enable our clients to understand exactly how we arrive at the figures in our overall capacity forecasts.

Base capacity. This section shows the capacity figures we use that are based on known projects, including new machines and major upgrades that have been approved, ordered and financed, as well as firm closure plans.

The following tables show the base capacity changes by country worldwide.

9.3 Individual Machine Investment Plans

Detailed, individual investment plan listings

In this section we provide detailed investment plan listings. In these tables we show all announced capacity plans, including those not classified as definite, decided and financed.

Individual machine details are shown in the tables following – where a ✓ indicates the item is included as decided, while a ✗ indicates that the item is undecided and hence excluded from our capacity analysis.

The complete listings follow.

9.1.1 Machine Investment Plans, Coated Woodfree Papers

FIGURE 111: INVESTMENT LISTING – COATED WOODFREE, EUROPE & AMERICA

Europe & America				
Company	HQ	Date	Comment	Cap (kt/Dec)
Finland				
Rhodi	Rovaniemi	Q1-Q4	Announced closure of the sole CWF machine on the mill	190
France				
Nolpeca	Nolpeca	Q1-Q3	Passed into ownership also as part of wholesale M/A group	
Germany				
Schreiber	Oberkreuzigen		Q1-Q3 MM taken over by Paper Excellence, an affiliate of APP	
Sand Sina	Unknown	Q1-1-11	Production in CWF output as firm puts focus on specialties	140
Rhodi	Ostermünster	Q1-Q3	Closure of CWF/specialty paper production on the mill	70
Sweden				
Rhodi	Hasslo	Q1-3	Old paper production remains following closure of Aspenbruk 03	
Switzerland				
Sappi	Biberist	Q1-Q3	Closure of the papermill after selling to Arctic Paper	220
EAST EUROPE				
Russia				
Ilim Group	Koryazhma	Q4-Q4	Planning to start up coated paper production on the mill	70
Arkhangelsk	Solvyt	Q1-1-11	Plans to build new coated paper machine on the mill	300
Slovenia				
Graf & Krug	Vevce	Q1-Q2	Mill put on for takeover by ROVESO Group	70
NORTH AMERICA				
USA				
Grand Rapids	Hamilton	Q1-Q4	Closure of the mill, but as looked for new buyer	40
Appleton	White Cornell	Q1-3	Closure of PM1, Domtar to supply base for thermal coating	100
